

# FFAG for High Intensity Proton Accelerator

Yoshiharu Mori  
Kyoto University, Research Reactor Institute  
(KURRI)

# Contents

- **Introduction**
- **Features**
- **Transverse focusing**
  - Zero chromaticity (scaling: fixed tunes)
    - "zero *chromaticity*"
  - Non-zero chromaticity (non-scaling: variable tunes)
    - "*fast resonance crossing*"
  - History of development
- **Acceleration(RF)** cf. induction: inefficient
  - Variable frequency
  - Constant frequency
- **Advancement of FFAG**
- **Proton driver**
- **Summary: beam power efficiency**

# FFAG: Fixed Field Alternating Gradient

## Static magnetic field

It is like cyclotron, but not much orbit excursion

### Fast acceleration

- *Fixed magnetic field allows the beam acceleration only by RF pattern. No needs of synchronization between RF and magnets.*

### Large repetition rate

- *High intensity with large repetition rate and modest number of particles in the ring*
- *Space charge and collective effects are below threshold.*

## 6D-Strong focusing (AG focusing, phase focusing)

It is like synchrotron.

### Large acceptance with small gap magnet

### Various longitudinal RF gymnastics become possible.

- *Bunching, Stacking, Coalescing, etc.*

# Type of FFAG optics

## Zero chromaticity

-  Fixed betatron tunes
  -  *Fields are non-linear.*
-  Free from betatron resonance crossing

## Non-zero chromaticity

-  Varied betatron tunes
  -  *Linear optics*
-  Fast resonance crossing

# Zero chromaticity FFAG

## Betatron eqs. in cylindrical coordinate

$$\frac{d^2x}{d\theta^2} + \frac{r^2}{\rho^2} (1 - K\rho^2) x = 0$$

$$\frac{d^2z}{d\theta^2} + \frac{r^2}{\rho^2} (K\rho^2) z = 0 \quad K = -\frac{1}{B\rho} \frac{\partial B}{\partial r}$$

## Zero chromacitiy: Constant betatron tunes

### Sufficient condition --> Scaling

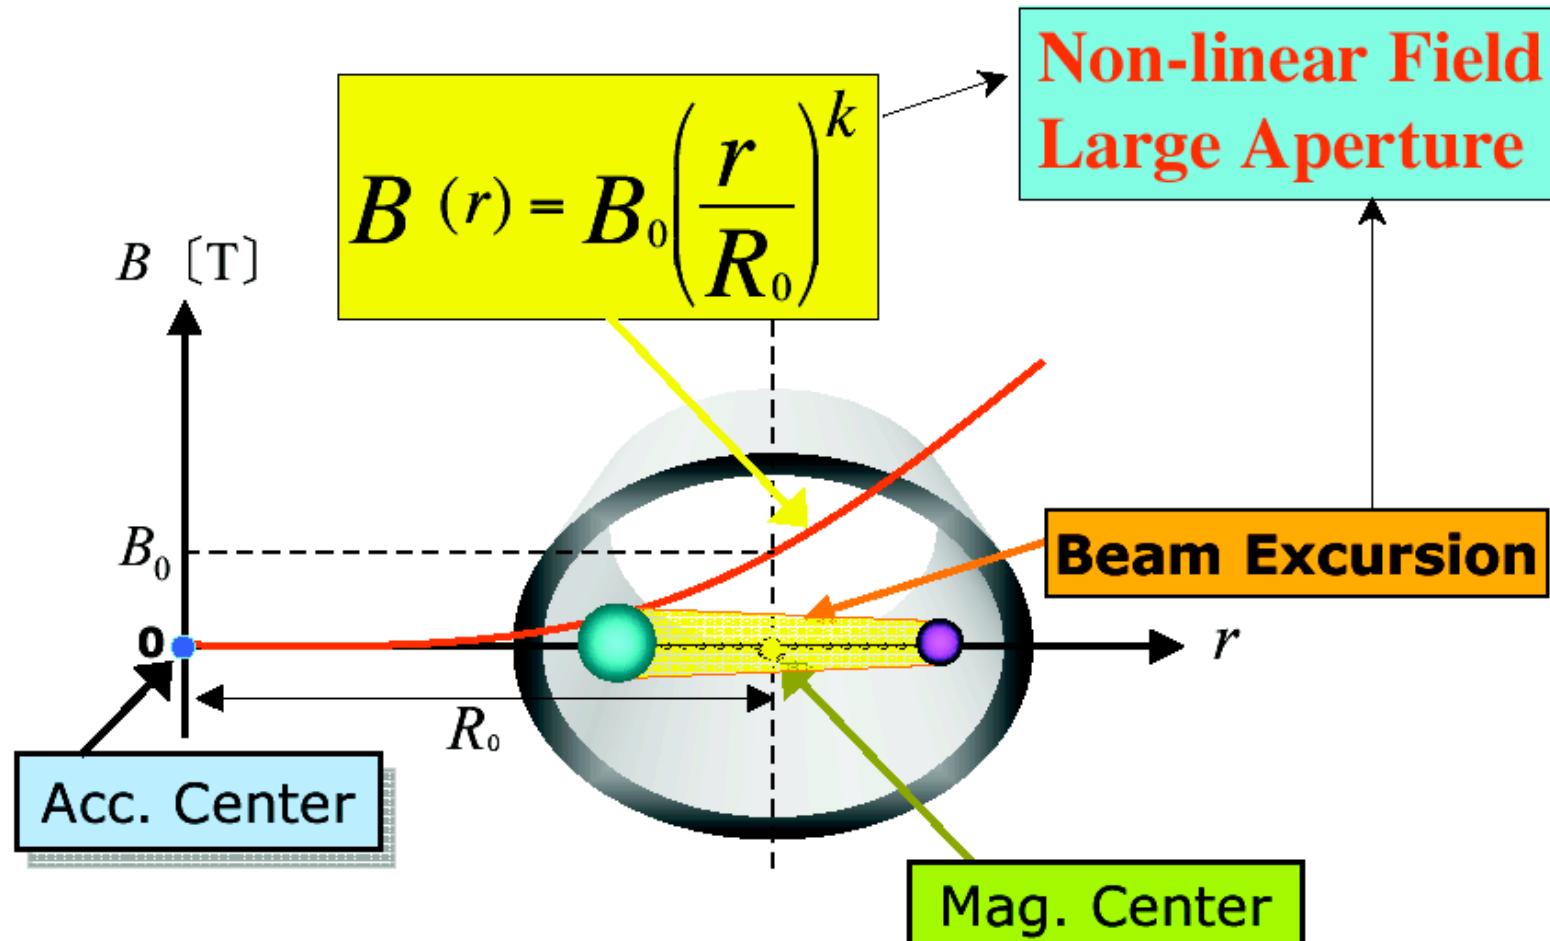

$$\begin{cases} \frac{d(r^2/\rho^2)}{dp} = 0 \\ \frac{d(K\rho^2)}{dp} = 0 \end{cases} \longrightarrow \begin{cases} r \propto \rho \\ \frac{r}{B} \left[ \frac{\partial B_z}{\partial x} \right]_{z=0} = k \end{cases}$$

$$B_z = B_0 \left( \frac{r}{r_0} \right)^k f(\theta)$$

Note: Above is not necessary & sufficient condition!

# Magnetic field of scaling FFAG

# Scaling FFAG lattice

Original idea ---> Ohkawa (1953)

“Zero chromaticity”

betatron eq.

$$x'' + g_x x = 0 ; \quad g_x = \frac{K^2}{K_0^2} (1 - n)$$

$$z'' + g_z z = 0 ; \quad g_z = \frac{K^2}{K_0^2} n$$

geometrical field index

$$\left. \frac{\partial}{\partial p} \left( \frac{K}{K_0} \right) \right|_{\theta=const.} = 0 \quad \left. \frac{\partial n}{\partial p} \right|_{\theta=const.} = 0$$

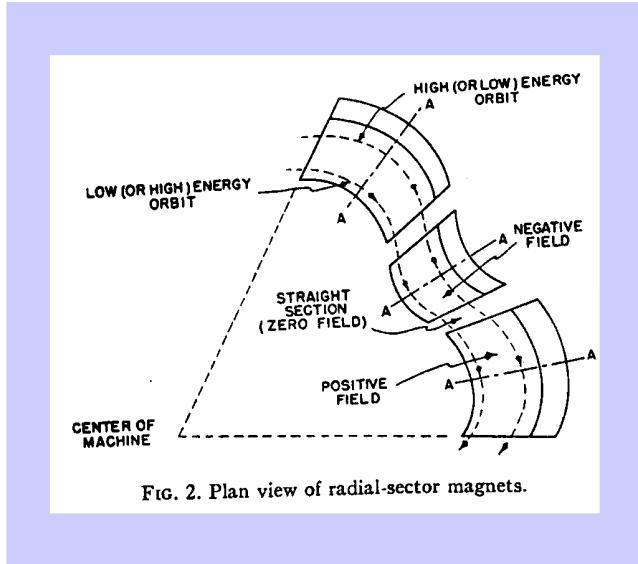

orbit similarity

no  $p$ -dependence

$$B(r, \theta) = B_i \left( \frac{r_i}{r} \right)^{n_0} F \left( \theta - \xi \ln \frac{r}{r_i} \right)$$

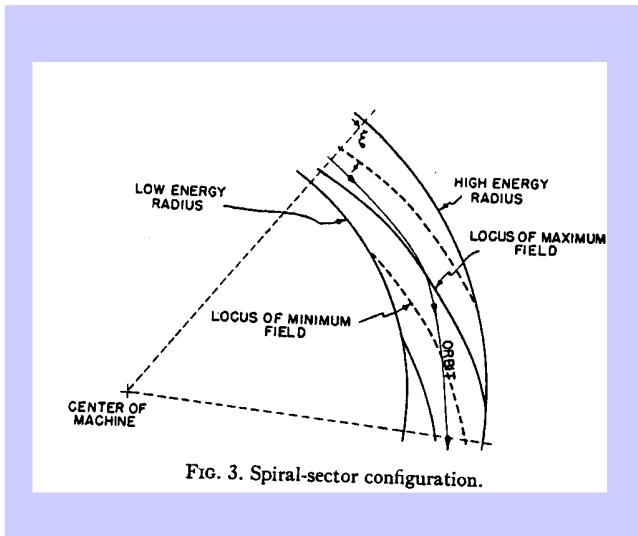

radial sector

negative bend  
FODO(DFDO)

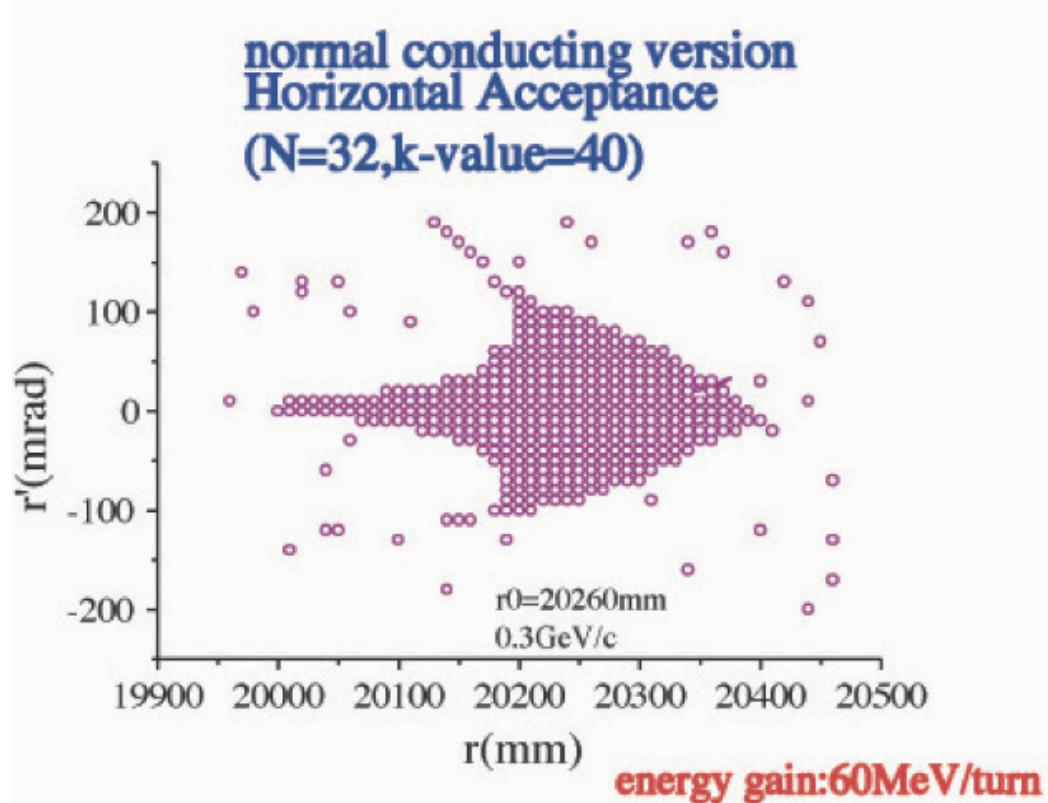

spiral sector

edge focus  
FFDO

AG focusing

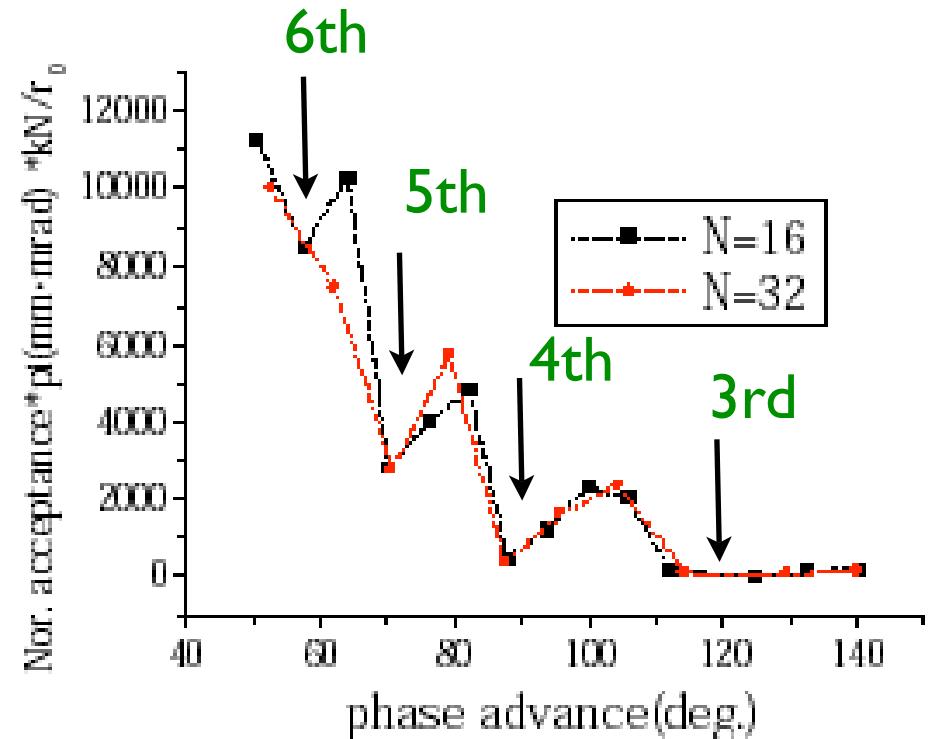

# Dynamic Aperture of Scaling FFAG

Quite large!

cf.  $A > 10,000 \text{ mm.mrad}$  for phase advance of  $\sim 90 \text{ degree}/\text{cell}$

$$\alpha = \frac{1}{k+1} : \text{momentum compaction factor}$$

Momentum Comapction: no higher orders  
 ----- momentum acceptance : large  
 ----- kinematic effects : small enough

# Non-zero chromaticity FFAG

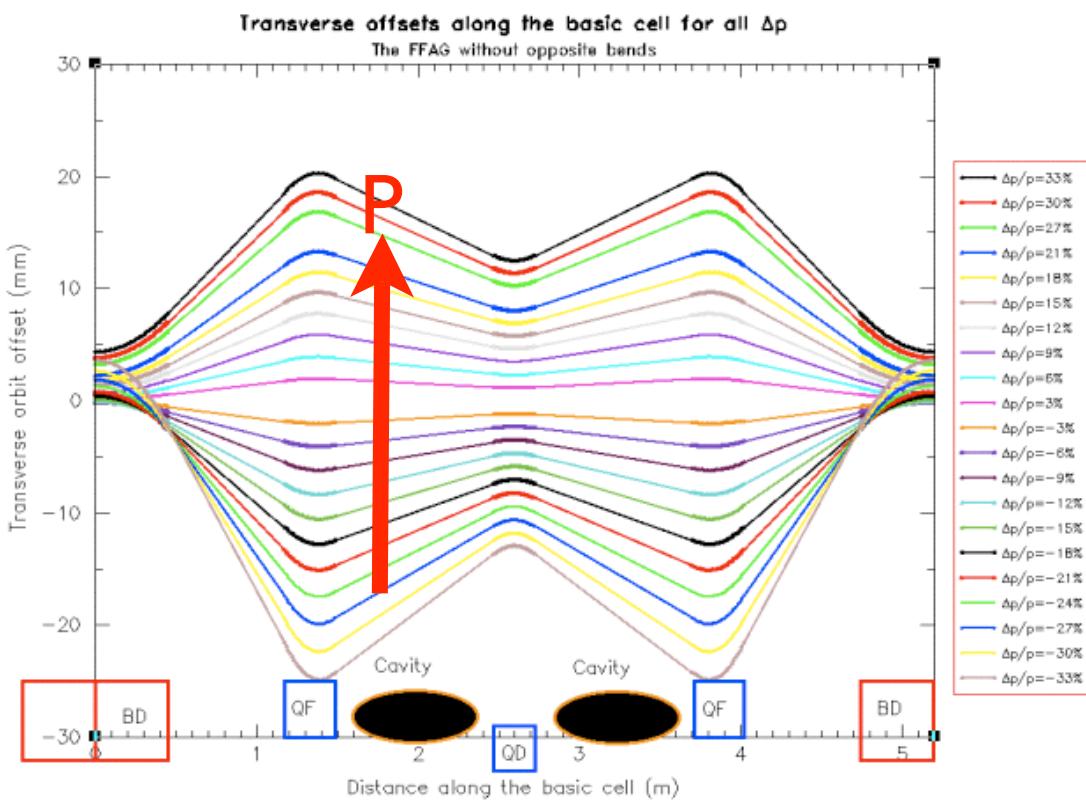

non-scaling

- Fields are linear: B,Q fields.

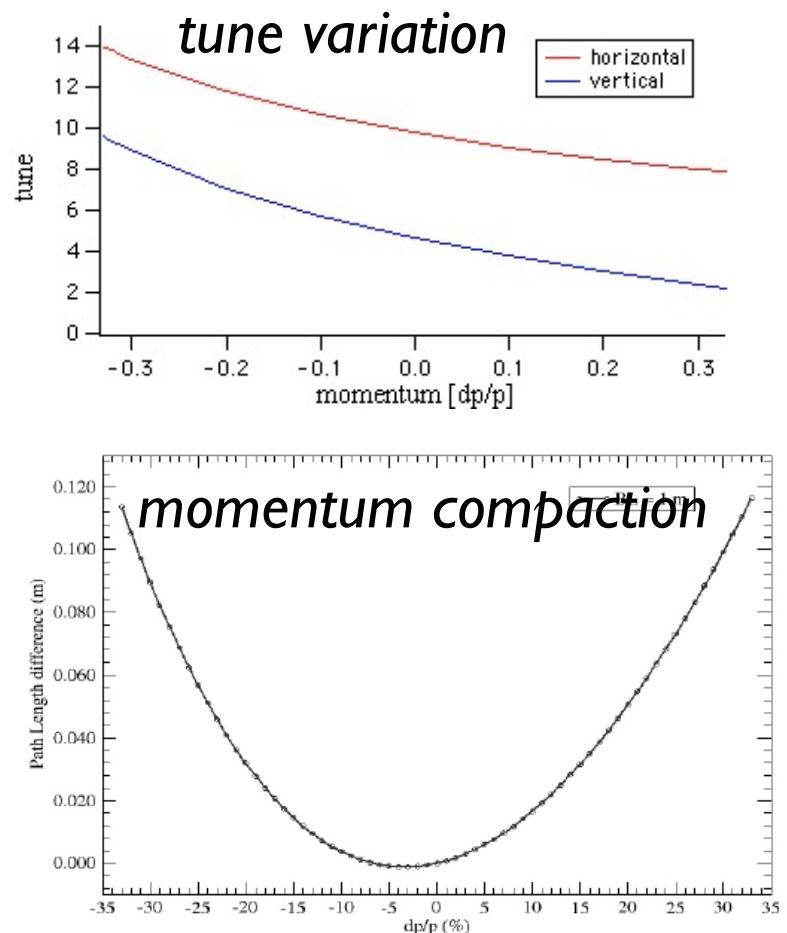

- momentum compaction: small enough  $\sim$ parabolic

- Tunes are varied: Fast resonance crossing

$$\alpha \approx C_1 \xi^2, \xi = \frac{\Delta p}{p}$$

transverse offset for all momentum

# FFAG Accelerators :history

## Ohkawa (1953), Kerst & Symon, Kolomenski

- MURA project e-model, induction acceleration ~'60s

- No proton FFAG for 50years!

## Proton FFAG (POP:World first p-FFAG, Mori et al.,2000)

- Complicated field configuration : 3D design
- MA(Magnetic Alloy) RF cavity :Variable Frequency & High Gradient.

- 150MeV p-FFAG (Mori et al.,2004)

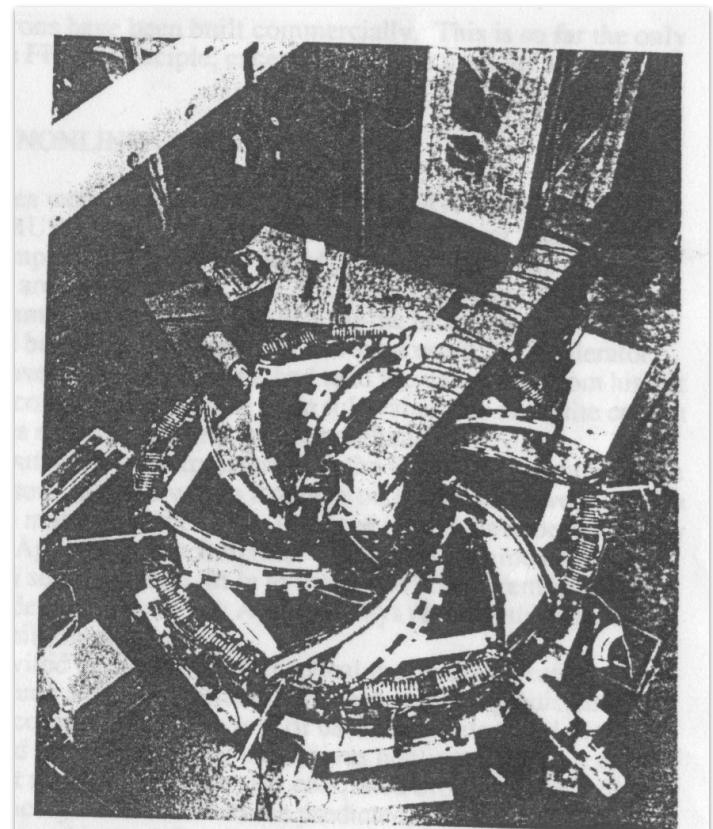

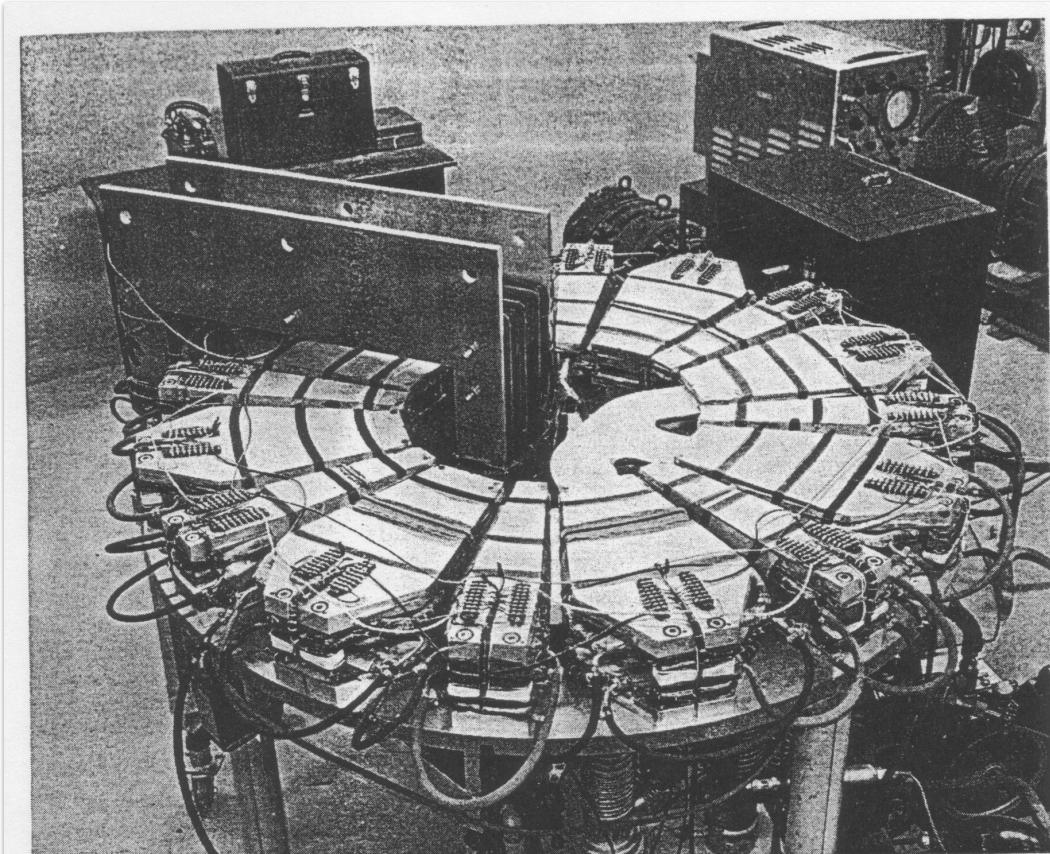

- PRISM FFAG(Kuno et al.,2008,Osaka)

- p-FFAG for ADSR study, ERIT neutron source (KURRI,2008)

- EMMA(e-FFAG for nuFact:World first non-scaling FFAG, England,under development)

# MURA FFAG ('60) Electron Model

- Radial & Spiral Induction & RF (const. f)
- No proton acceleration

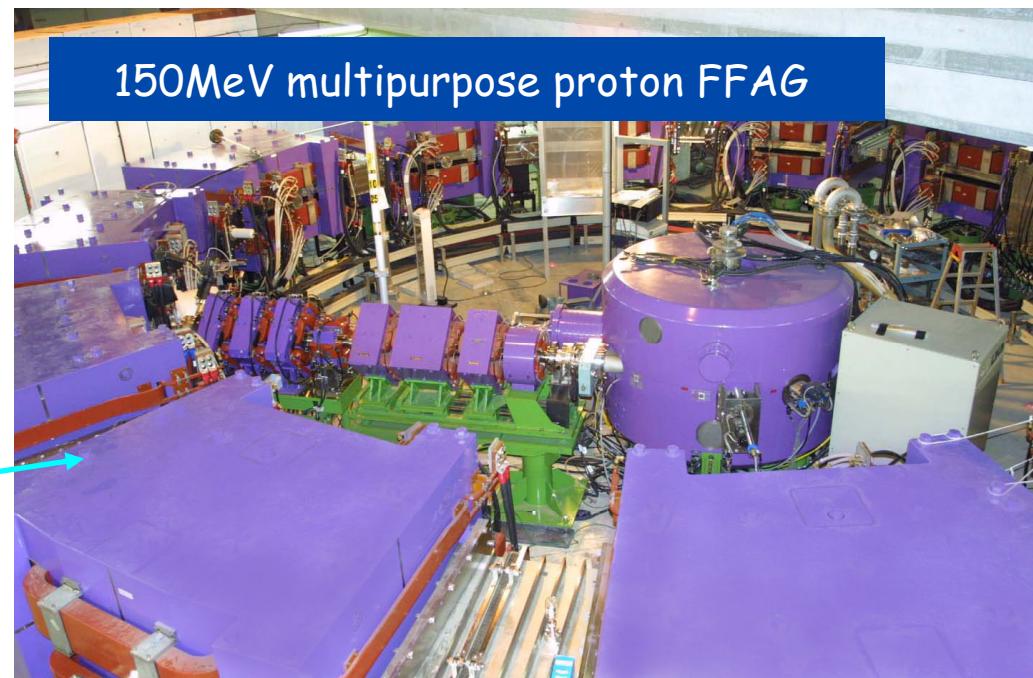

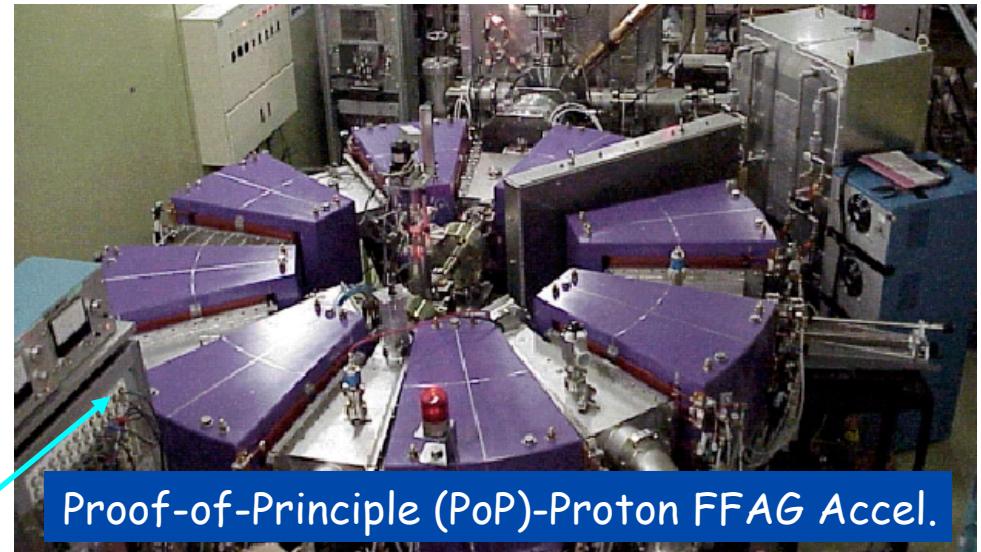

# History of FFAG Proton Accelerator

- 1953: Basic concept by Ohkawa  
*Proton FFAG accelerator was not successful until recent*
  - difficulty in fabricating RF cavity with variable frequency & high gradient field
- 1998: Development of RF cavity using Magnetic Alloy  
*Grant-in-Aid for Scientific Res. by MEXT: Y. Mori, KEK*
- 2000: Demonstration of Proton FFAG Accelerator -POP FFAG-  
*Grant-in-Aid for Scientific Res. by MEXT: Y. Mori, KEK*

**WORLD's FIRST PROTON FFAG!**
- 2004: Development of 150MeV multipurpose FFAG accelerator  
*100Hz Operation!*
  -

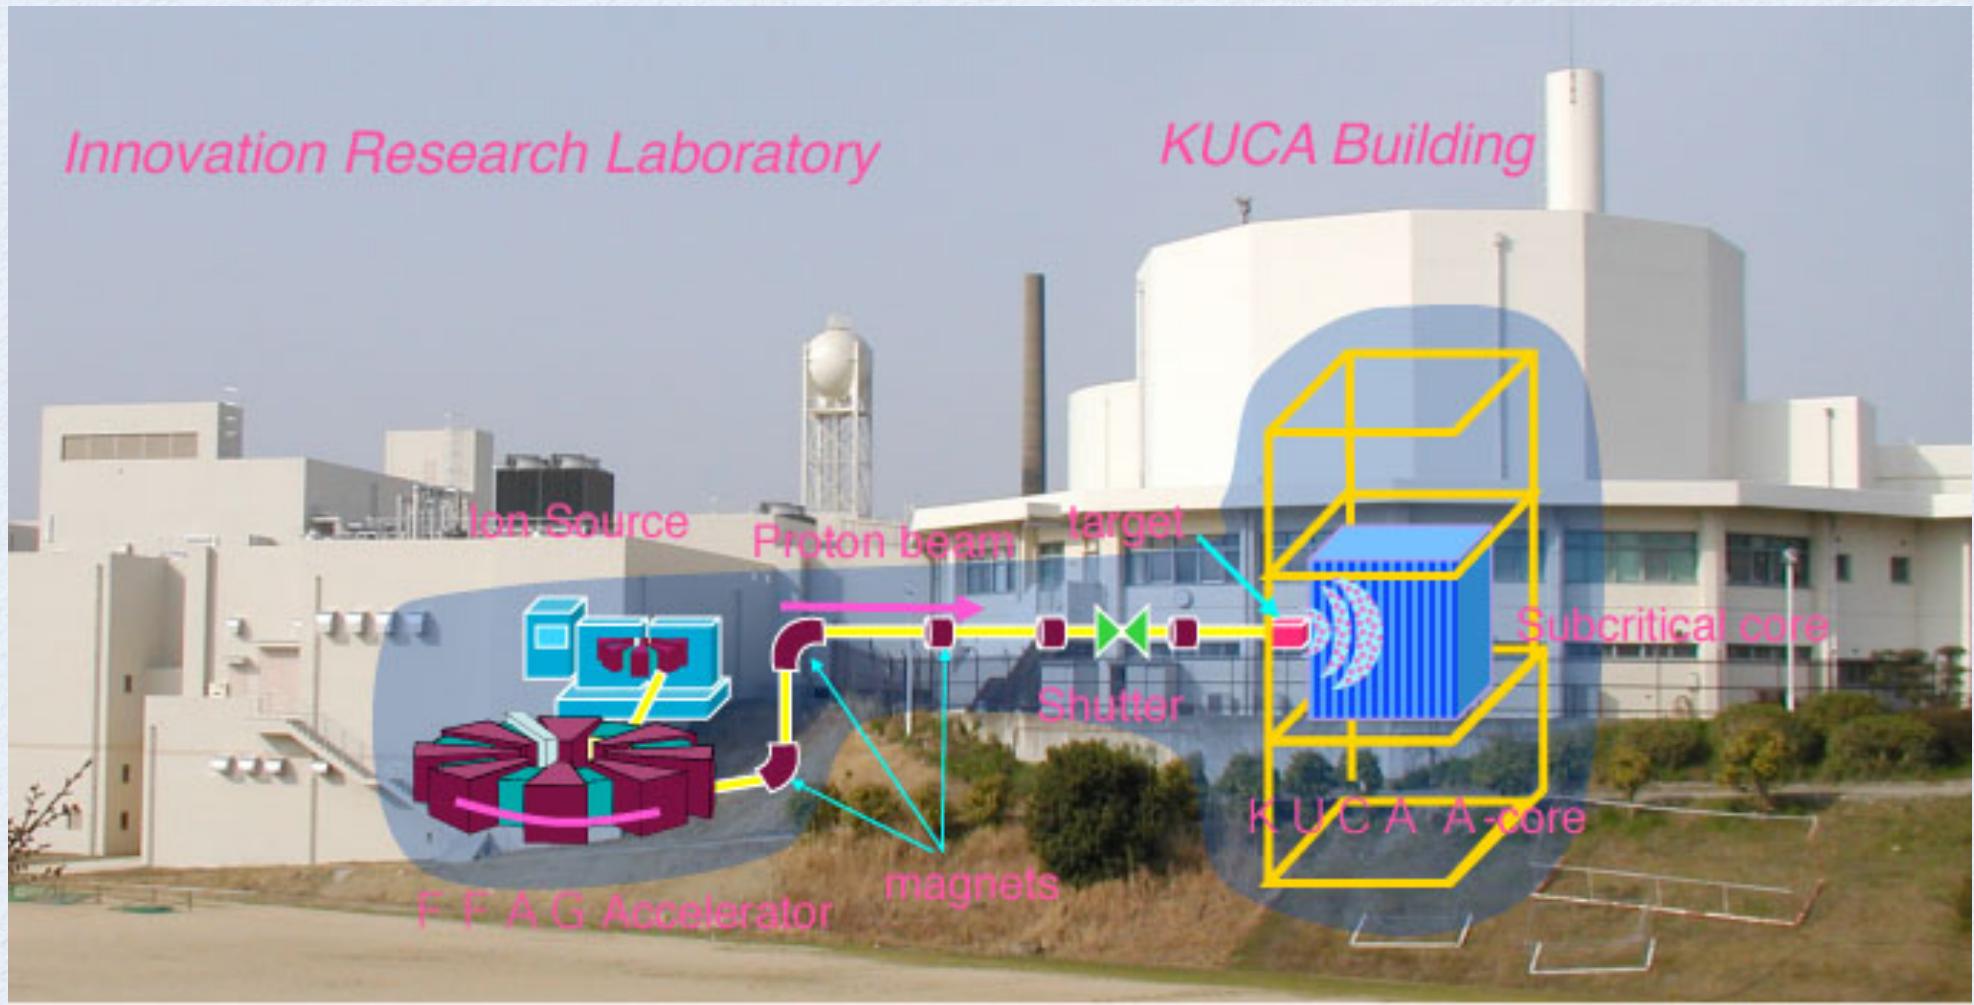

*Grant-in-Aid for Creative Basic Res.:Y.Mori*

# FFAG-ADSR project at KURRI

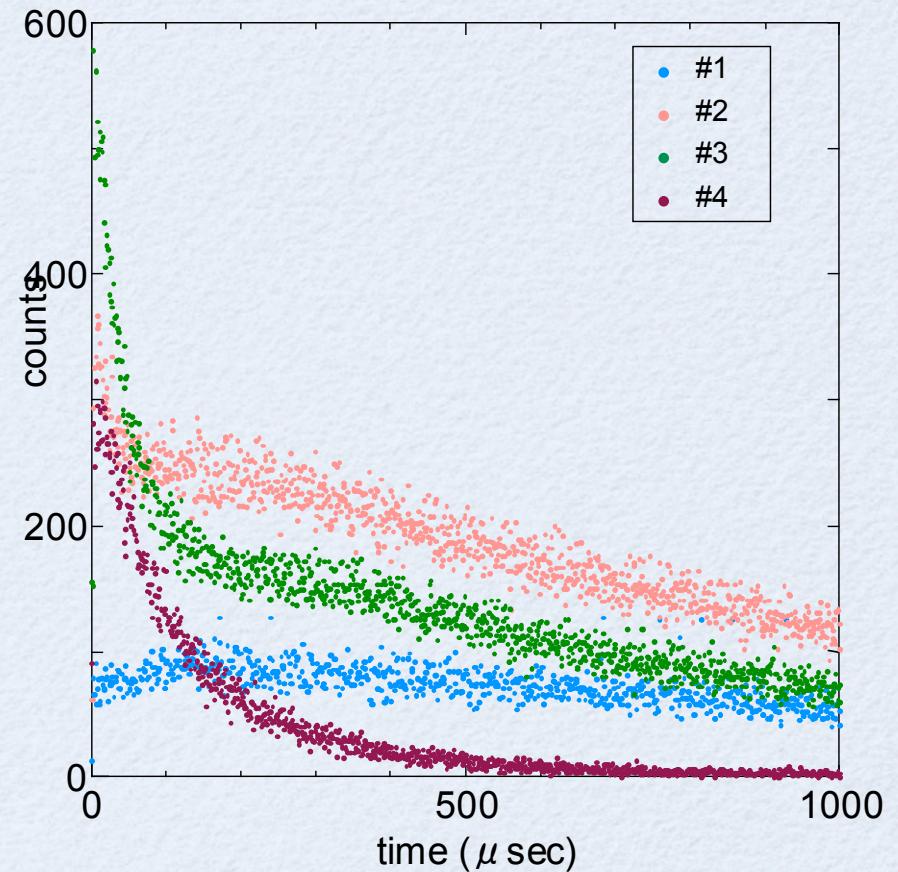

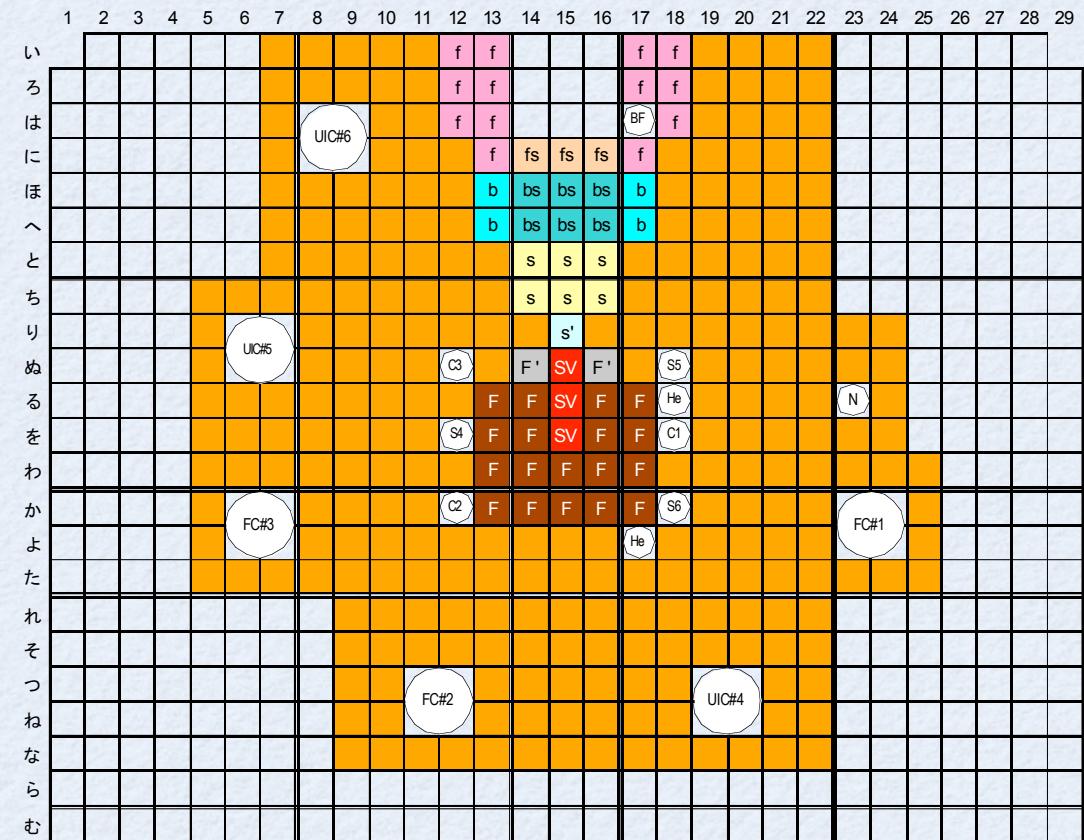

# First experimental data FFAG-KUCA for ADSR study

# Neutron time structure

At various positions in the reactor

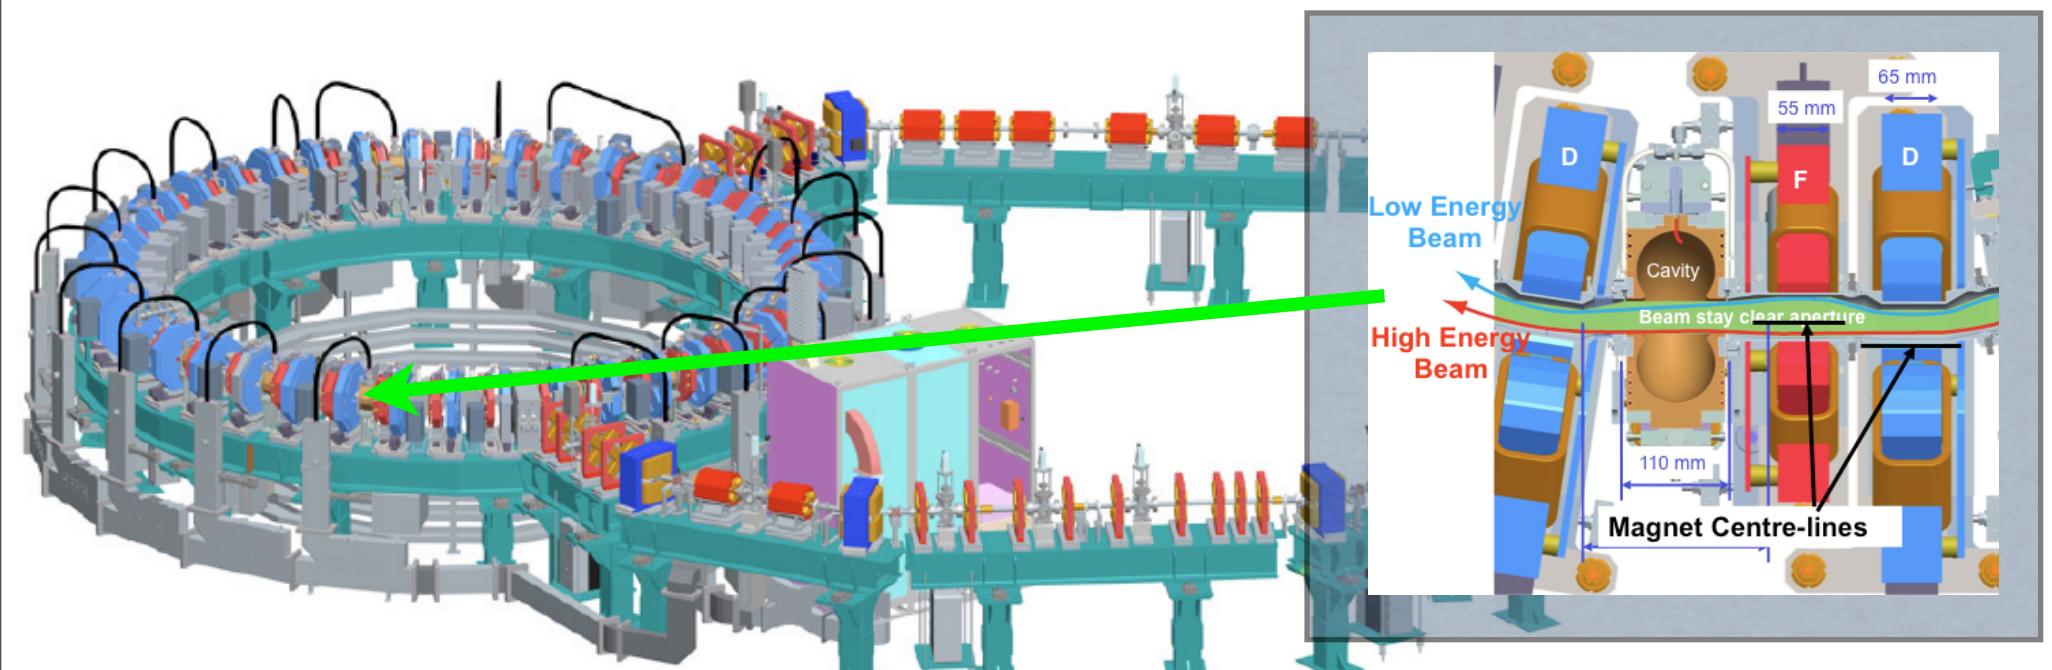

KUCA reactor core

# Non-zero chromatic FFAG

## EMMA

*the World's First Non-Scaling FFAG Accelerator*

Susan Smith STFC Daresbury  
Laboratory

# Acceleration(RF)

## Beam acceleration in FFAG: various and flexible

- Momentum compaction can be tuned along orbit swing.
  - Keeping *phase stability* like synchrotron
  - Realizing *isochronism* like cyclotron

## Variable frequency RF

- Broad-band RF cavity : Scaling & Non-scaling
  - MA(magnetic alloy) cavity     $Q \sim I$

## Fixed frequency RF

- Stationary RF bucket acceleration : Scaling
  - constant momentum compaction(MC)
- Gutter RF acceleration : Non-scaling
  - relativistic beam & small MC(parabolic) :semi-isochronous
- Harmonic number jump acceleration : Scaling (non-scaling)
  - non-zero slippage factor

# Variable RF frequency

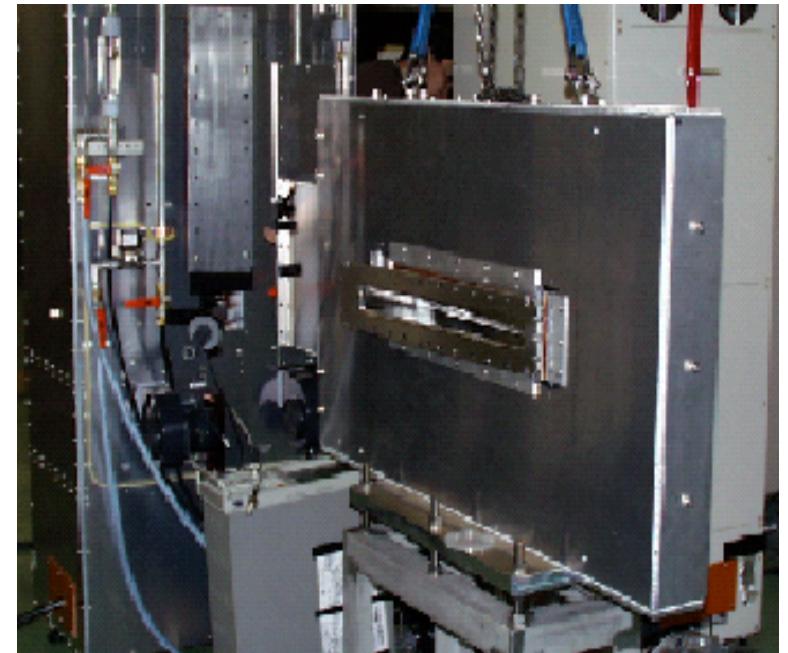

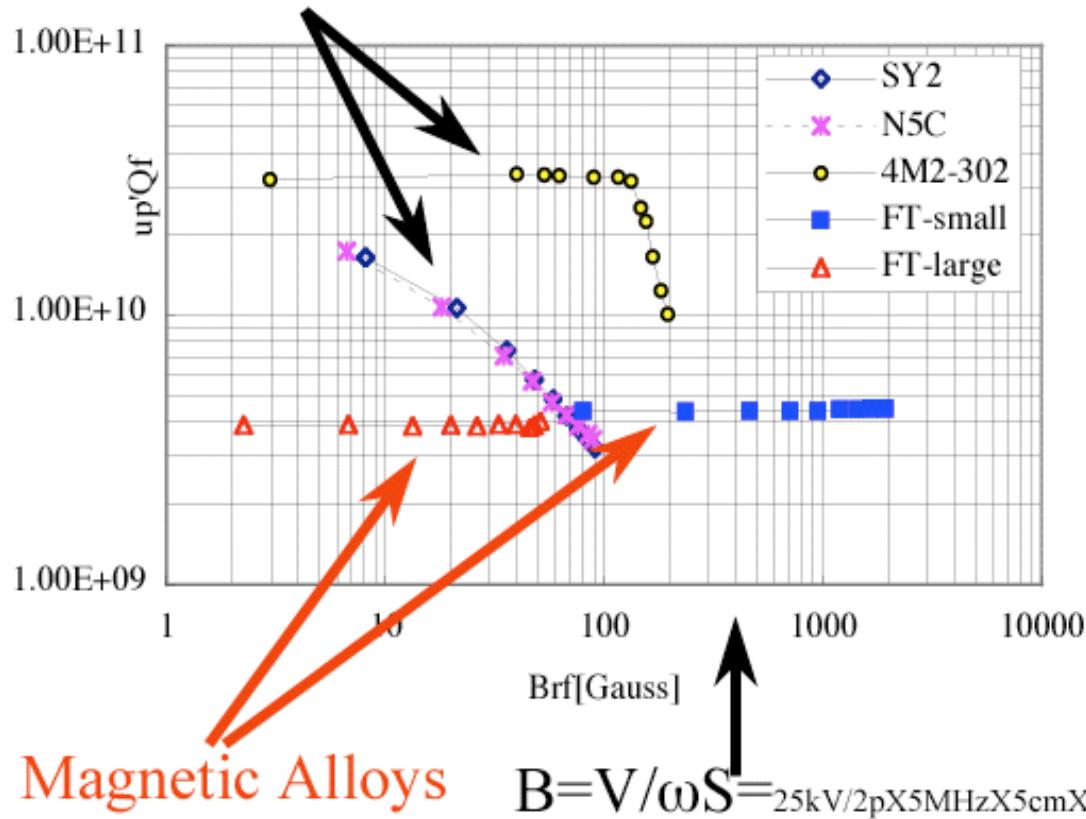

## Broad-band RF cavity : MA(magnetic alloy) cavity

- Fast acceleration requires fast frequency(phase) change.

*Low Q ( $Q \sim I$ ) is essential !*

- Adequate both for scaling and non-scaling FFAGs.

Ferrites

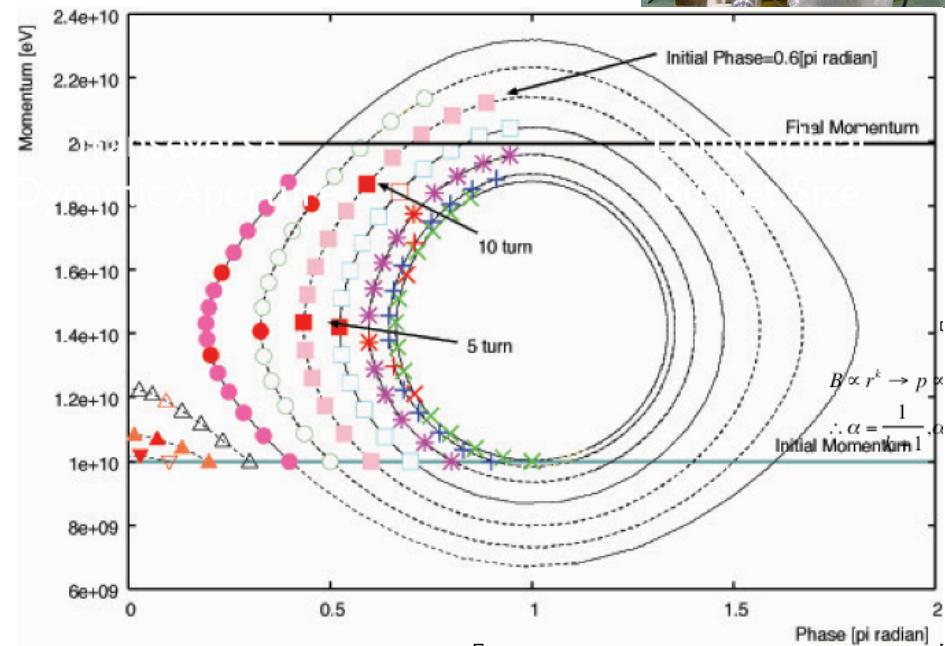

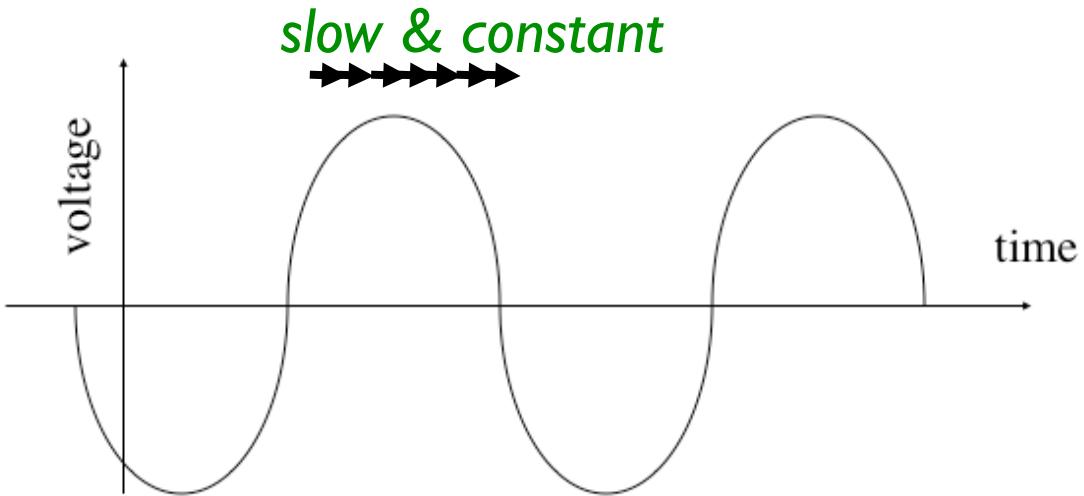

# Fixed RF frequency(I)

## Stationary bucket acceleration

- Constant & small enough phase slip --- Large energy gain
  - relativistic beam*
  - constant Momentum Compaction*
- Adequate for scaling FFAG

$$\eta = \frac{1}{\gamma^2} - \alpha \approx -\alpha = -\frac{1}{k+1}$$

# Fixed frequency (2)

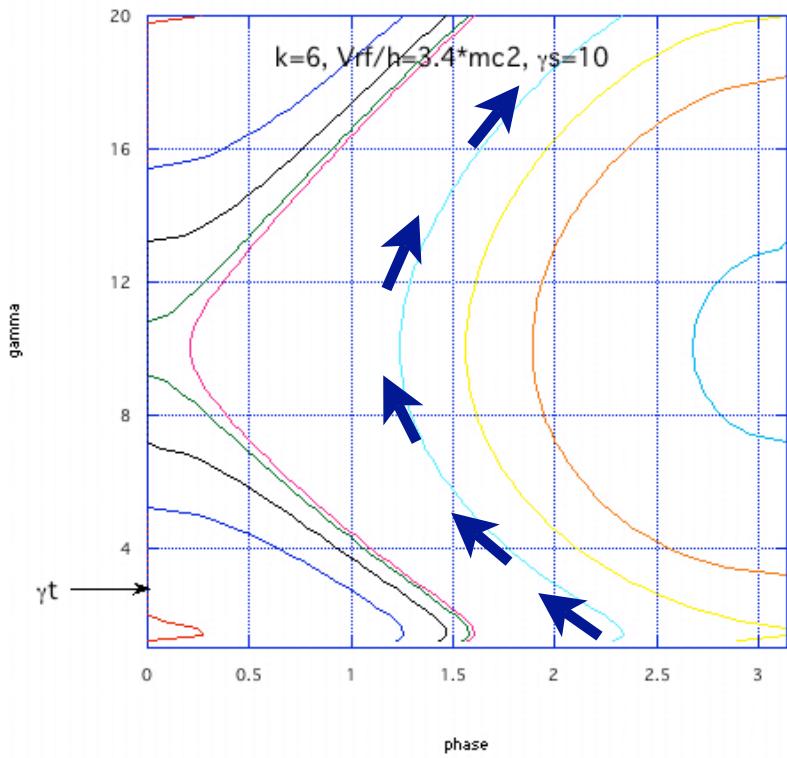

## Stationary bucket acceleration

- Non-relativistic to relativistic
- Longitudinal Hamiltonian in scaling FFAG

$$H = 2\pi m_0 c^2 \left[ \frac{(\gamma_s^2 - 1)^\lambda}{2\gamma_s} \frac{(\gamma^2 - 1)^{-\lambda+1}}{(1-\lambda)} + \gamma \right] + e \frac{V_{rf}}{h} f_0 \cos \phi$$

$$\lambda = \frac{k}{2(k+1)}$$

$$\frac{dp}{dT} = 0 : p = \gamma_1 \text{ and } \gamma_2$$

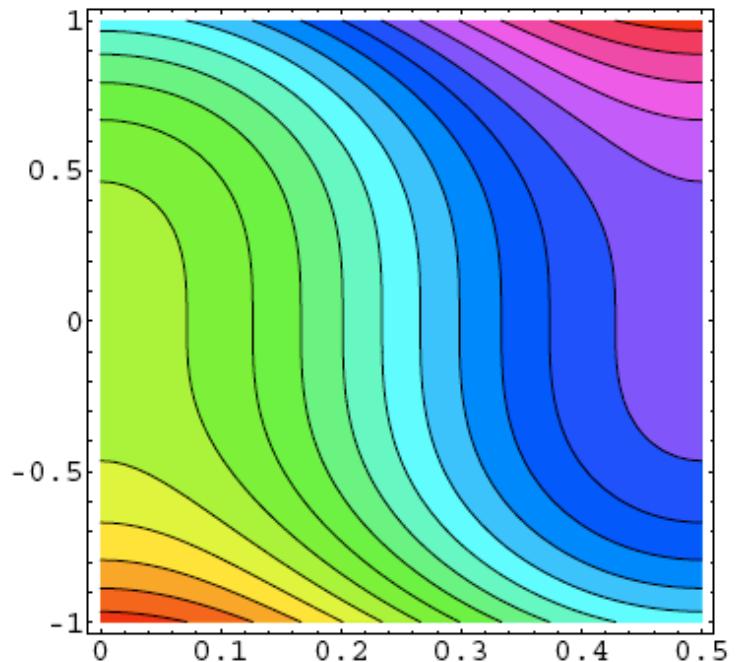

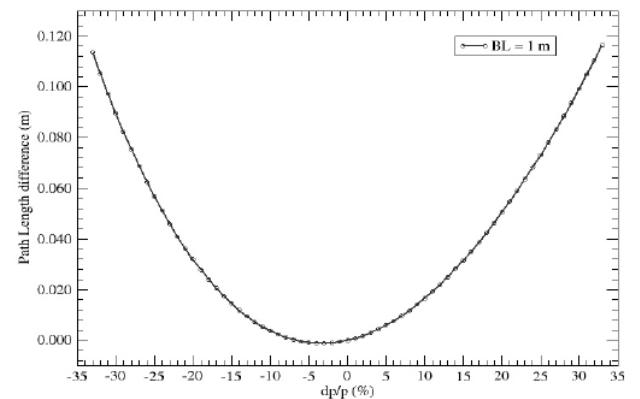

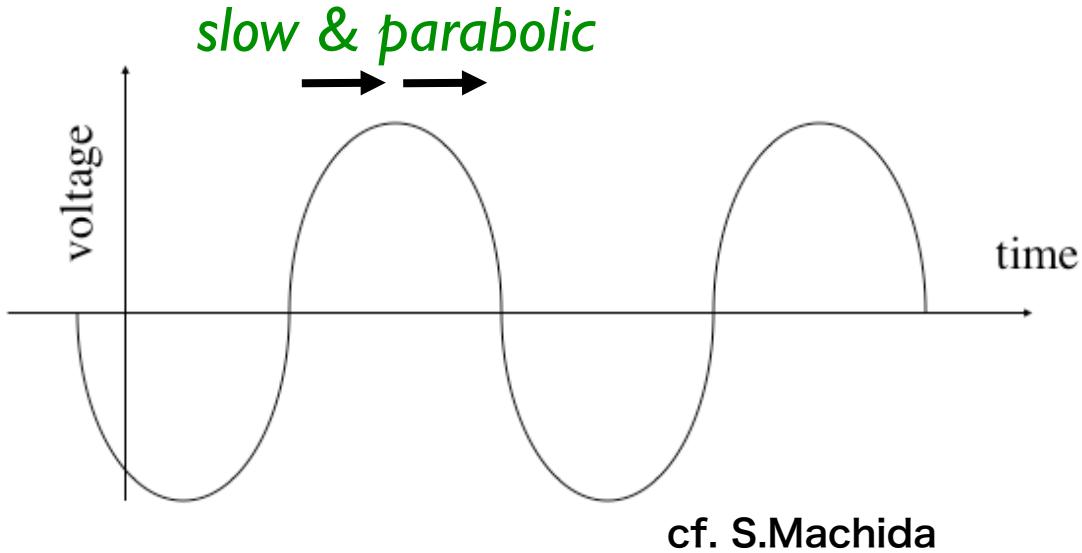

# Fixed RF frequency(3)

## Gutter RF acceleration

- Parabolic & small enough phase slip
  - relativistic beam
  - small parabolic Momentum Compaction
- Adequate for non-scaling FFAG

# Fixed RF frequency(4)

## Harmonic number jump acceleration

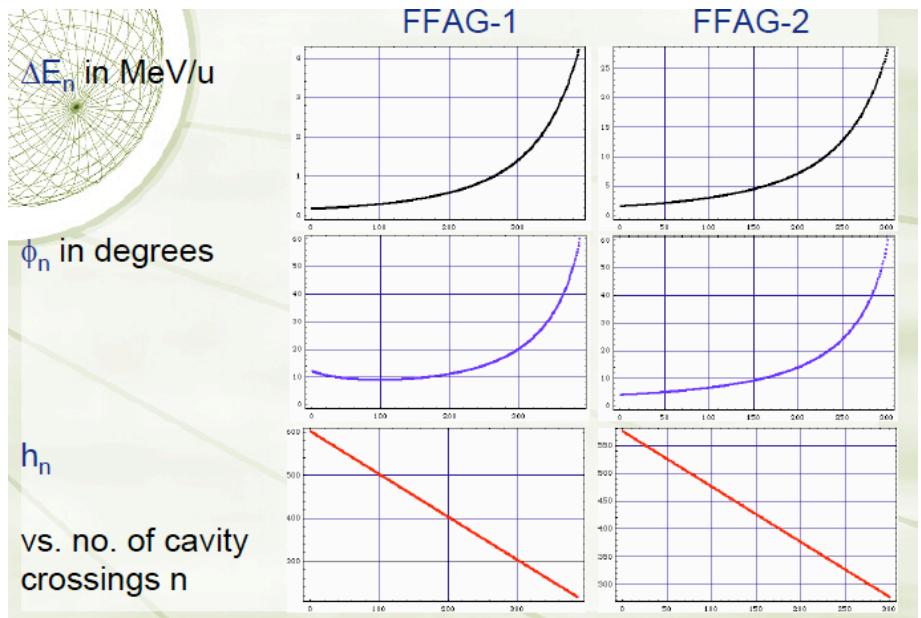

- $m$ :integer,  $m < 0$ : before transition,  $m > 0$ : after transition

- $\bullet$  Energy gain/turn can be automatically tuned if the RF voltage is high enough. ---> **Phase stability**

## Time slip/turn: $m \times Trf$

$$T_{i+1} - T_i = \frac{m}{f_{RF}}$$

cf. A.Ruggiero(BNL)

# Advancement of FFAG

## Zero chromaticity (scaling) FFAGs

### Pro/

- Fixed field & Strong focusing
- Zero chromaticity
  - constant betatron tunes → no-resonance crossing
- Large acceptance (longitudinal & transverse)

### Con/

- Relative large dispersion: Orbit excursion is large.
  - Large horizontal aperture magnet
  - Large horizontal aperture rf cavity → Low frequency
- Short straight section
  - Injection/Extraction difficulties → Kicker/Septum needs large apertures.
  - Available space for rf cavity is limited.

Need long straight section with small dispersion  
keeping “Zero Chromaticity”.

# Scaling FFAG linear line

Is it possible to make a linear FFAG straight line?

- keeping a scaling law: zero chromaticity
- reducing dispersion: dispersion suppressor
- making a good match with ring: insertion

Magnetic field configuration for FFAG linear line?

- Obviously not:

$$B = B_0 \frac{r}{r_0}^k f(\theta)$$

# Scaling field

## linear (straight) transport line

### Betatron eqs.

$$\frac{d^2x}{dy^2} + \frac{1}{\rho^2}(1 - K\rho^2)x = 0$$

$$\frac{d^2z}{dy^2} + \frac{1}{\rho^2}(K\rho^2)z = 0$$

### Scaling conditions: zero-chromaticity

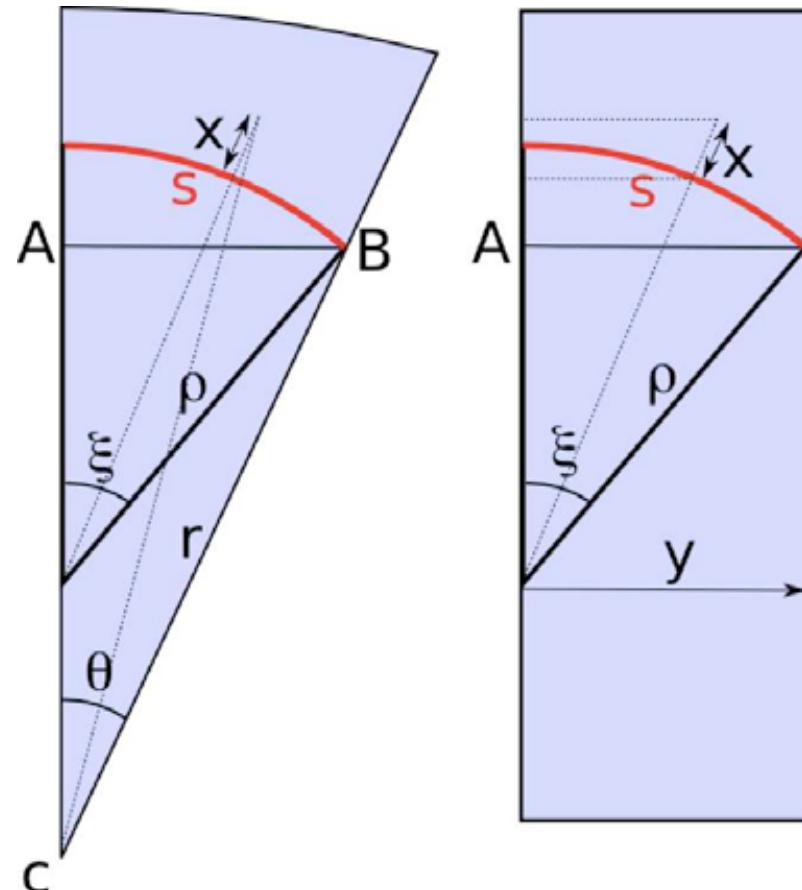

$$\begin{cases} \frac{d(1/\rho^2)}{dp} = 0 \\ \frac{d(K\rho^2)}{dp} = 0 \end{cases} \longrightarrow \begin{cases} \rho = \text{const.} \\ \frac{1}{B} \left[ \frac{\partial B_z}{\partial x} \right]_{z=0} = \frac{n}{\rho} \end{cases}$$

### sufficient cond.

### Magnetic field

$$B_z = B_0 \exp \left[ \frac{n}{\rho} x \right]$$

$$\left[ \lim_{r_0 \rightarrow \infty} \left( \frac{r}{r_0} \right)^k = \lim_{r_0 \rightarrow \infty} \left[ \left( 1 + \frac{x}{r_0} \right)^{\frac{r_0}{x}} \right]^{\frac{x}{r_0} k} = \lim_{r_0 \rightarrow \infty} \left[ \left( 1 + \frac{x}{r_0} \right)^{\frac{r_0}{x}} \right]^{\frac{n}{\rho} x} = \exp \left( \frac{n}{\rho} x \right) \right]$$

# Scaling linear line

## Example (JB. Lagrange)

Perfect scaling(zero-chromatic) FFAG linear transport line

proton 80-200MeV

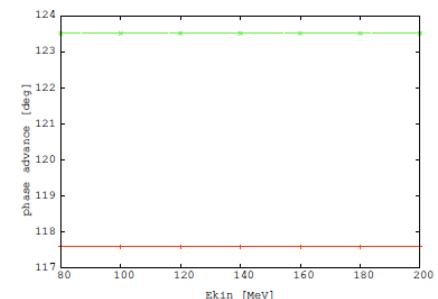

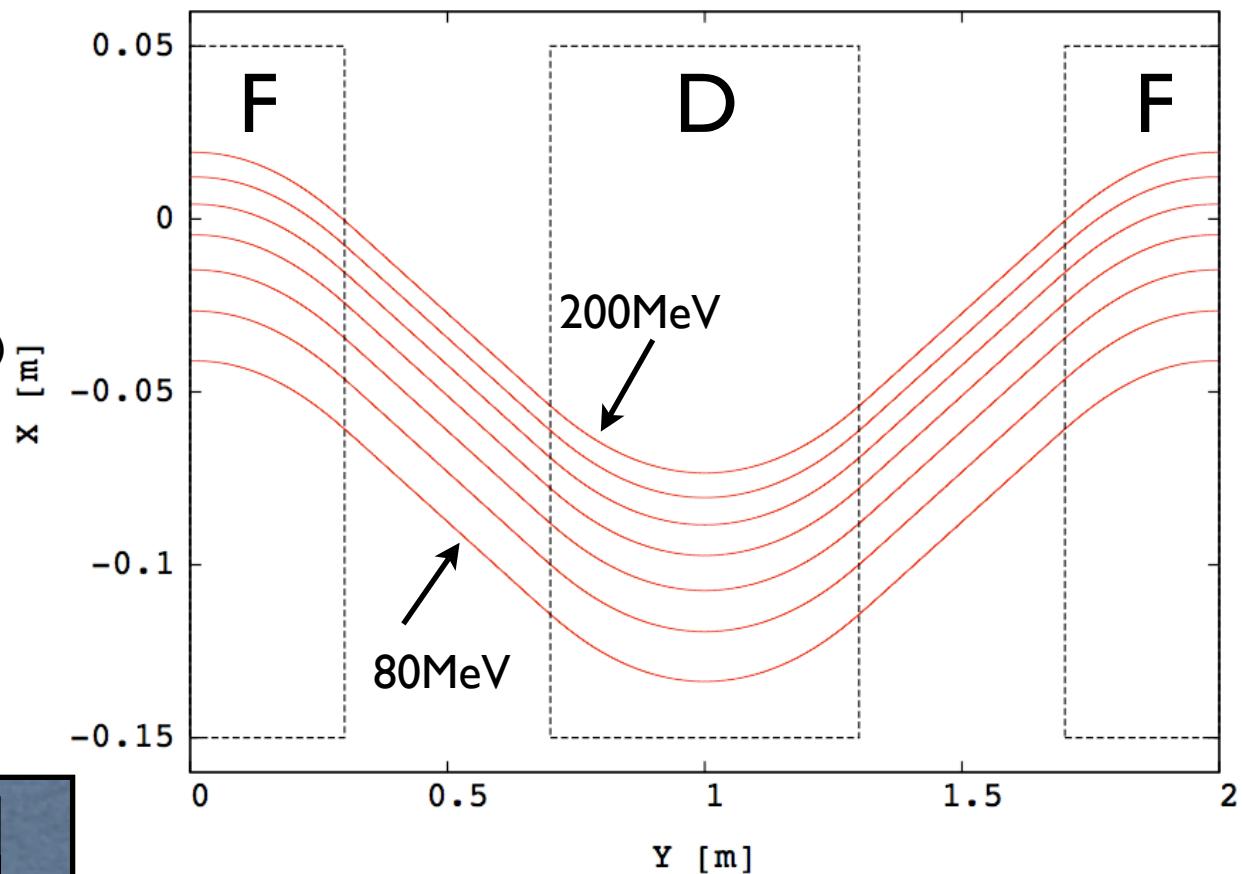

Table 1: Tracking parameters

Length of the magnets	60 cm
Drift	40 cm
Kinetic energy range	80 to 200 MeV (proton)
Field index	17
Local curvature radius	2.1 m
Step size	1 mm
Phase advances:	
horizontal $\mu_x$	104.8 deg.
vertical $\mu_z$	112.5 deg.

B-field

$$B_z = B_0 \exp\left[\frac{n}{\rho} x\right]$$

# Dispersion suppressor

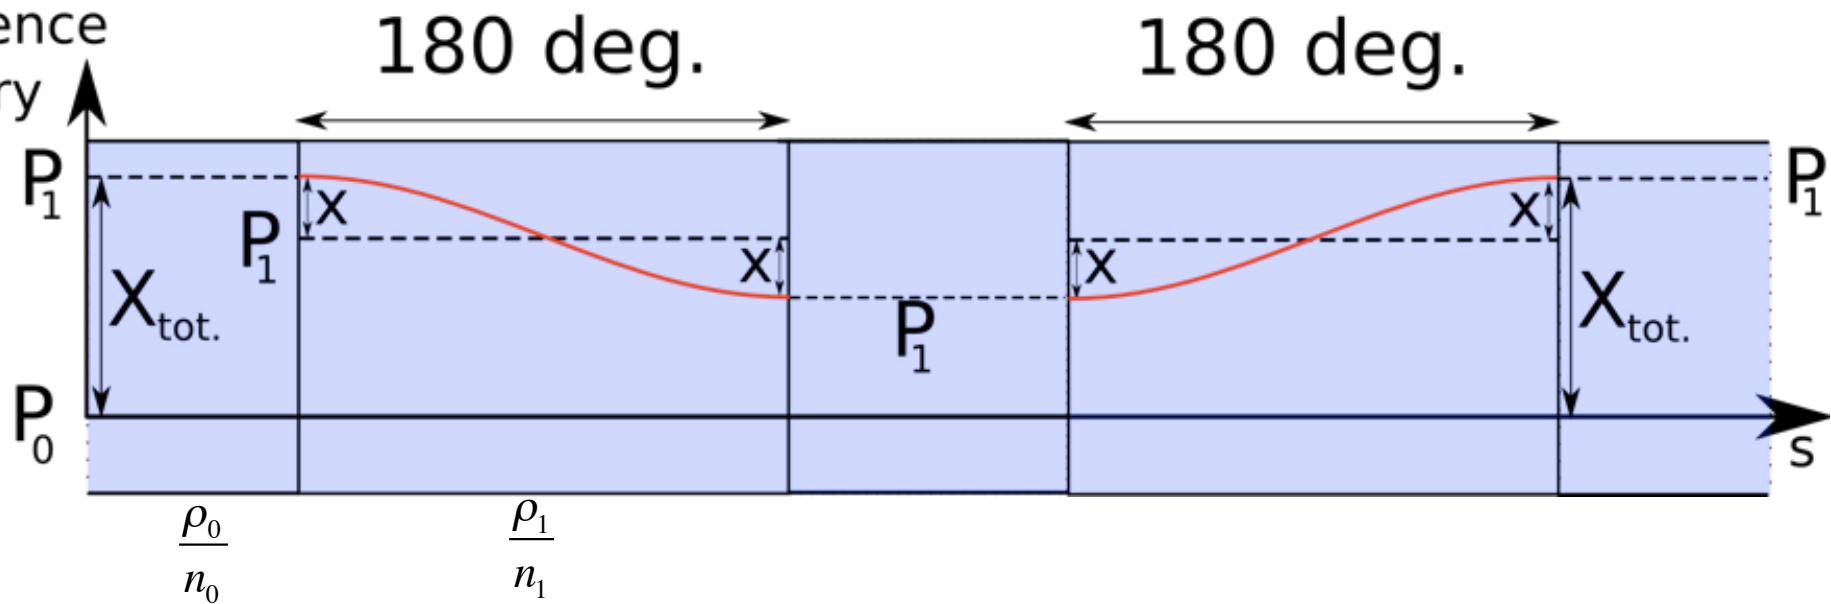

## Dispersion suppressor (Planche,Lagrange,Mori)

- successive  $\pi$ -cells in the horizontal plane can suppress the dispersion.

$$X_{tot} = X_1 - X_0 = \frac{1}{n / \rho} \ln \left( \frac{P_1}{P_0} \right)$$

$$x = \ln \left( \frac{P_1}{P_0} \right) \left( \frac{\rho_0}{n_0} - \frac{\rho_1}{n_1} \right)$$

distance to  
P<sub>0</sub>-reference  
trajectory

# Insertion Matching

btw. ring & straight line

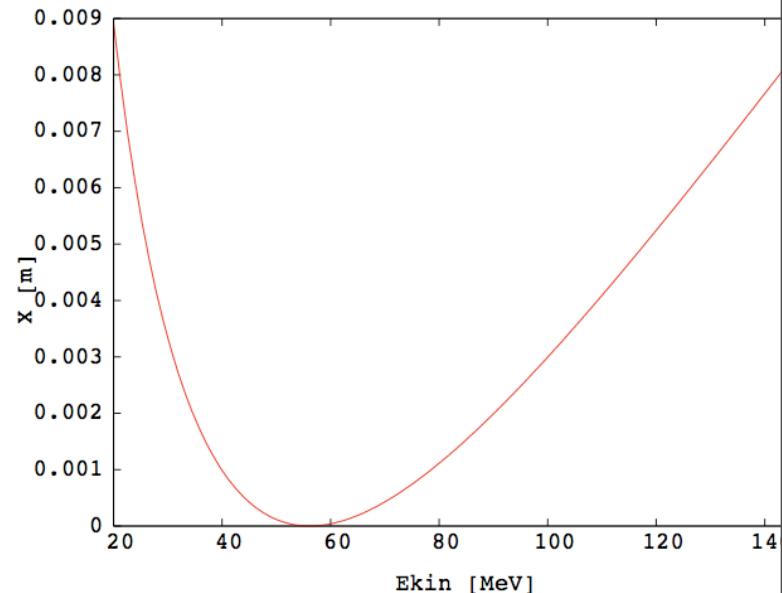

## B(closed orbit) matching condition

$$\left(1 + \frac{x}{r_m}\right)^{k+1} = \exp\left(\frac{n}{\rho}x\right)$$

ring                          linear line

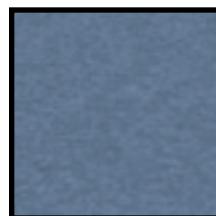

$$\frac{k+1}{r_m} = \frac{n}{\rho}$$

← 1st order

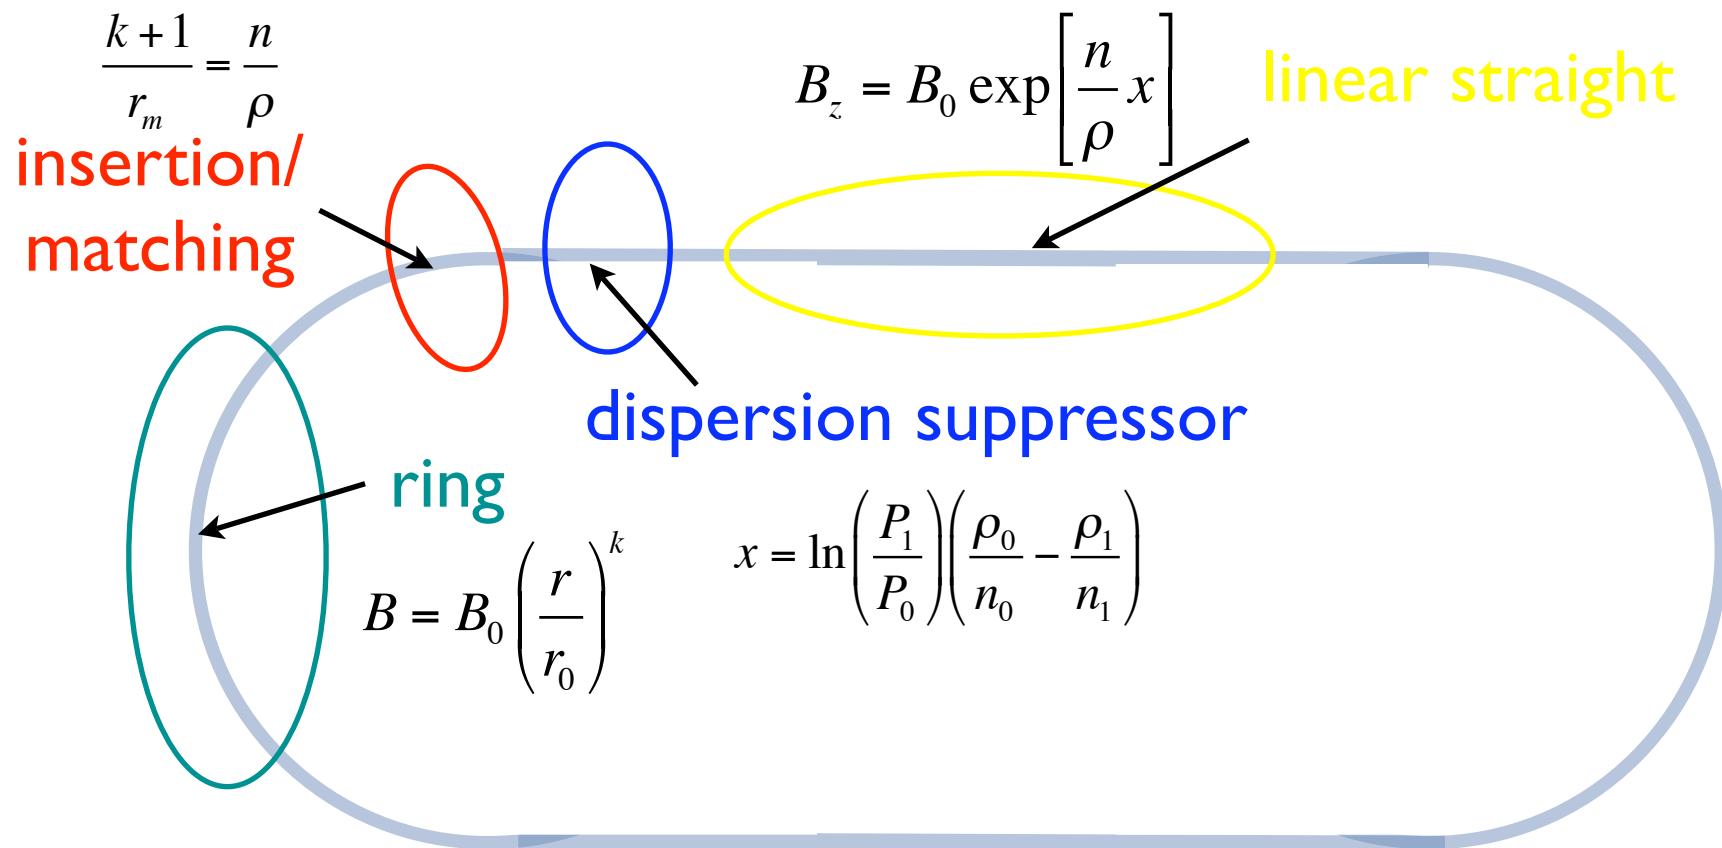

Example: 150MeV p-FFAG ring(KURRI) with insertion

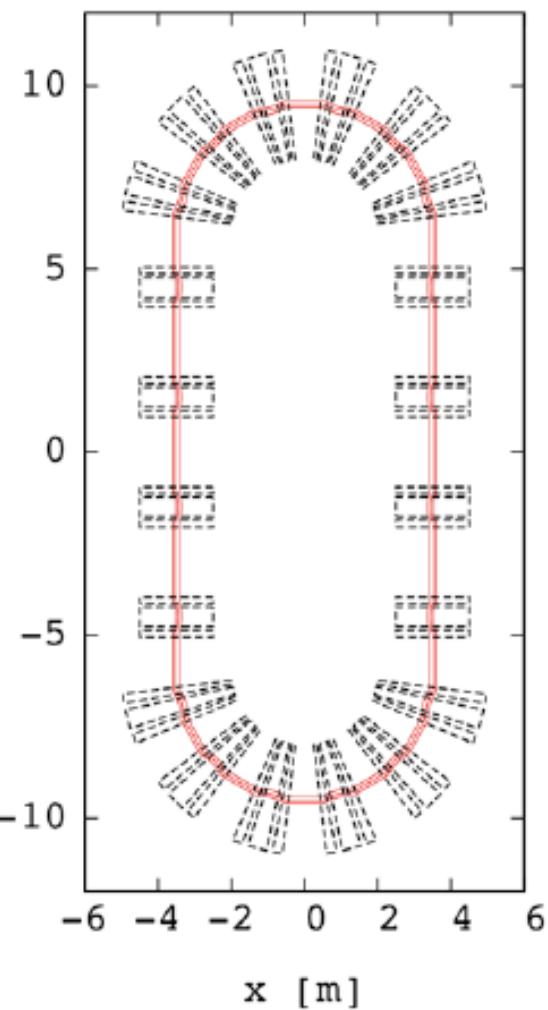

CO mismatch  
higher order error:  
→ smaller for larger ring

# Advanced scaling FFAG

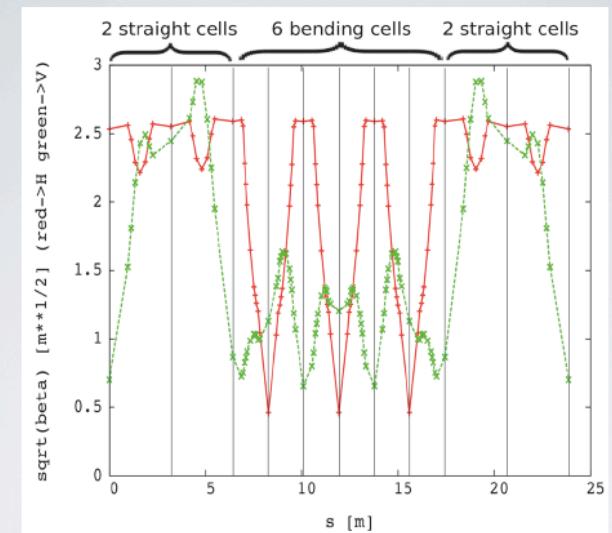

# Muon phase rotation PRISM ring

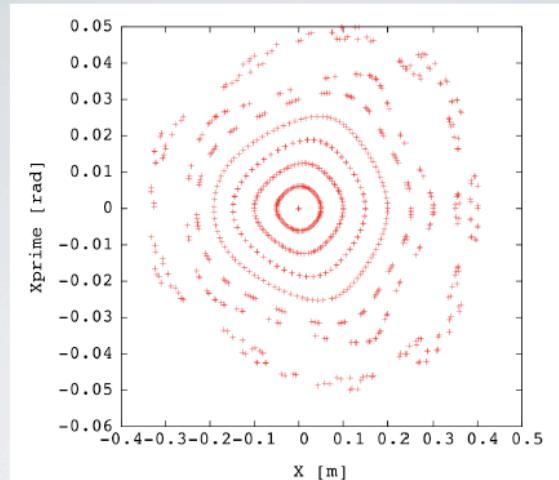

## PRISM LATTICE

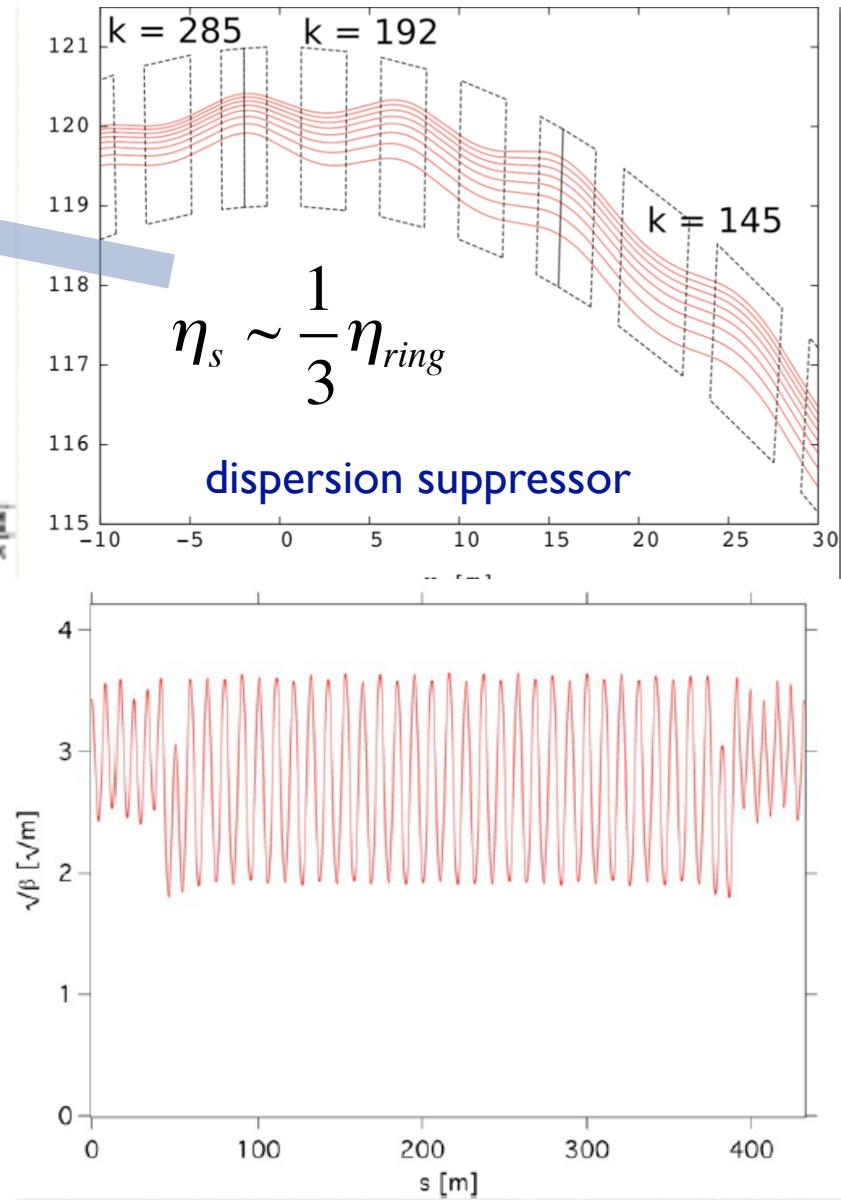

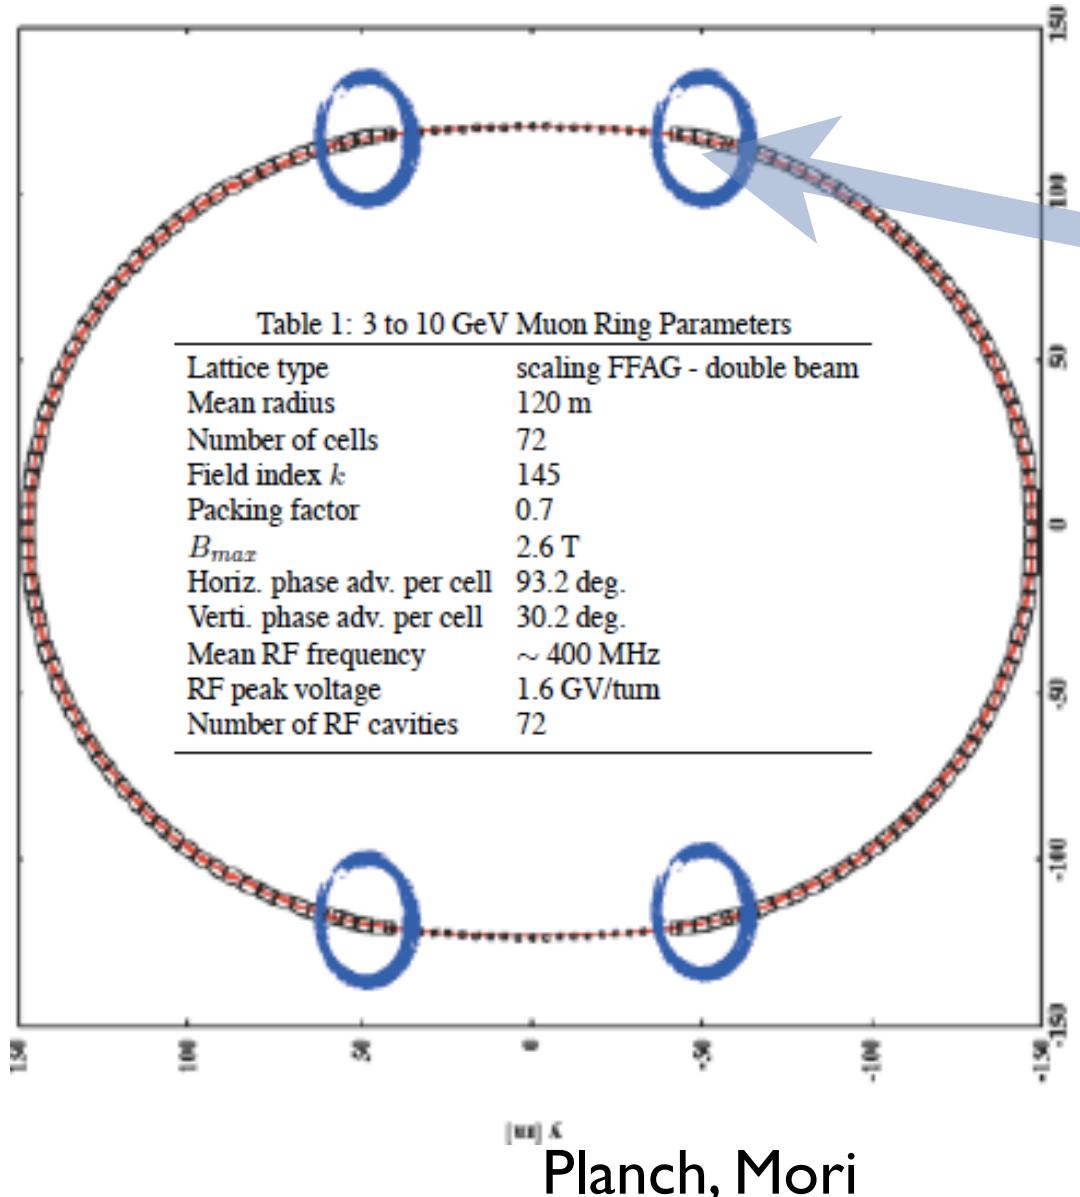

Bending cell	
$k$	6.5
Average radius	3.5 m
Phase advances:	
horizontal $\mu_x$	90 deg.
vertical $\mu_z$	90 deg.
Dispersion	0.47 m
Straight cell	
$n/\rho$	$2.14 m^{-1}$
Length	3 m
Phase advances:	
horizontal $\mu_x$	24 deg.
vertical $\mu_z$	87 deg.

Betafunctions of bending and straight cells (half ring)  
(red: horizontal, green: vertical)

# Muon accelerator neutrino factory

# Proton driver

## ● Muon Source (neutrino factory, muon collider etc.)

### ● Pulsed muon source

- Beam energy : 5-20GeV
- Beam power: >4MW
- Bunched beam: 1sec , ~10Hz

## ● Accelerator Driven Sub-critical Reactor(ADSR)

### ● Neutron source

- Beam energy: 1-2GeV
- Beam power:>10MW
- CW/High Rep. Rate >kHz

# Proton driver for neutrino factory

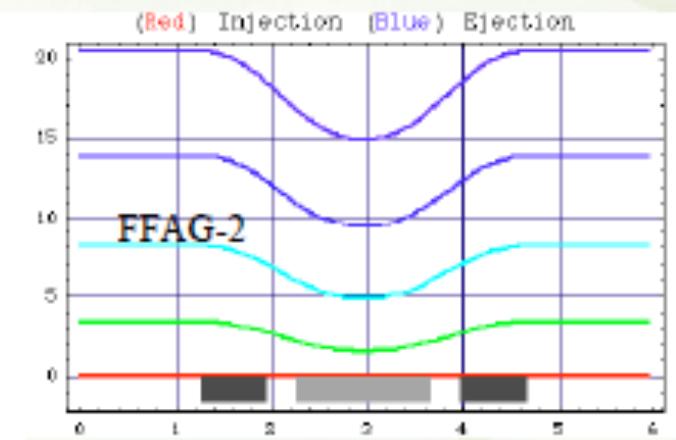

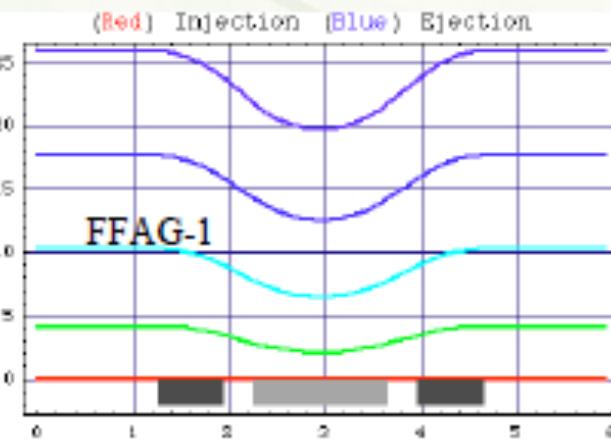

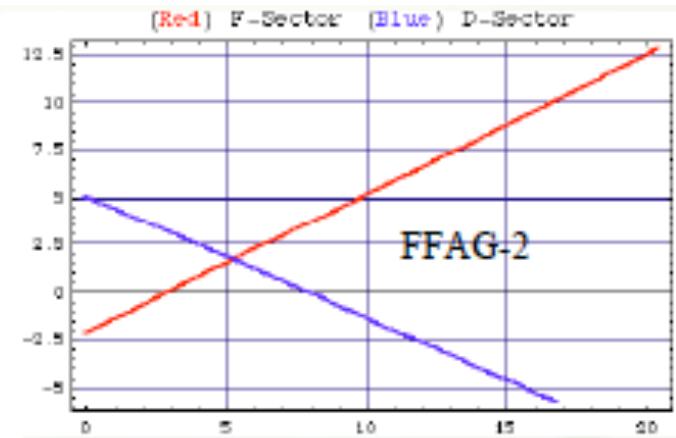

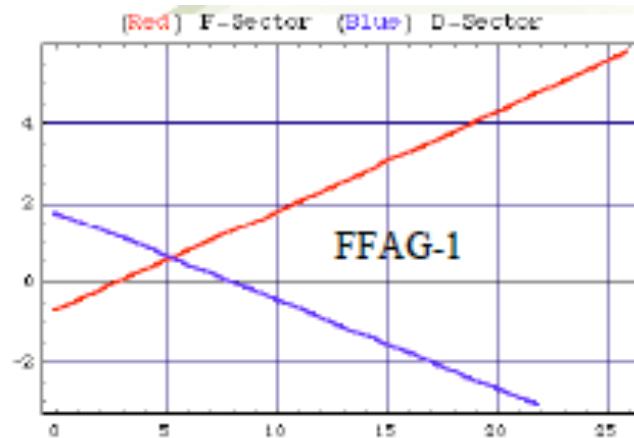

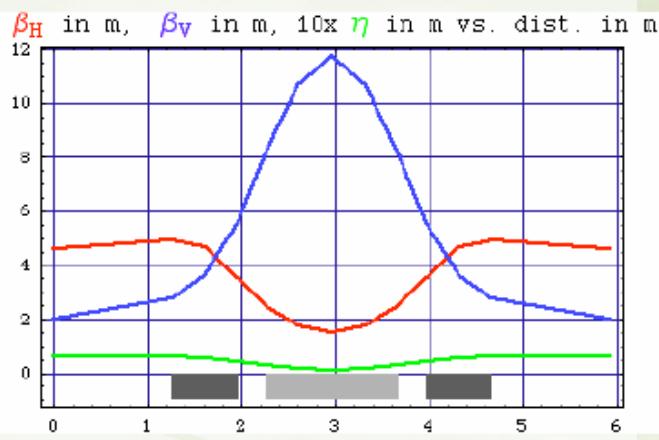

## Design works

- Non-zero chromatic(linear) FFAG :A.G.Ruggiero (BNL)
  - $E=11.6\text{GeV}$  ( two rings)
  - Lattice: O-BF-BD-BF-O, MC=linear for momentum
  - Harmonic number jump acceleration
- Zero chromatic (non-linear) FFAG :G.Rees(Rutherford Lab.)
  - $E=10\text{GeV}, 50\text{Hz}$
  - Lattice:O-bd-BF-BD-BF-bd-Q including non-linear bd
  - variable frequency RF acceleration

# Non-scaling FFAG by A.G.Ruggiero (BNL)

## Beam Parameters

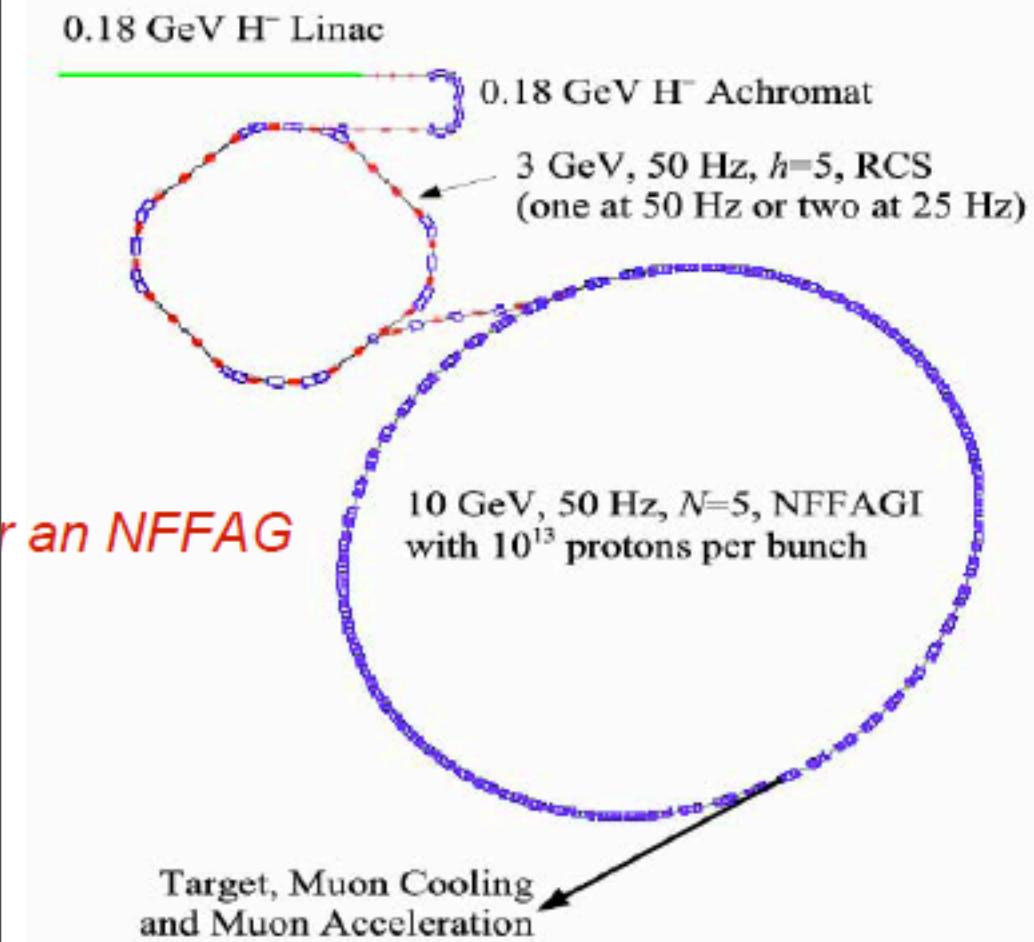

$E = 1.6 \text{ GeV}$

Tune variations & orbit excursion

## Semi-scaling(achromatic) FFAG by G.Rees(Rutherford Lab.)

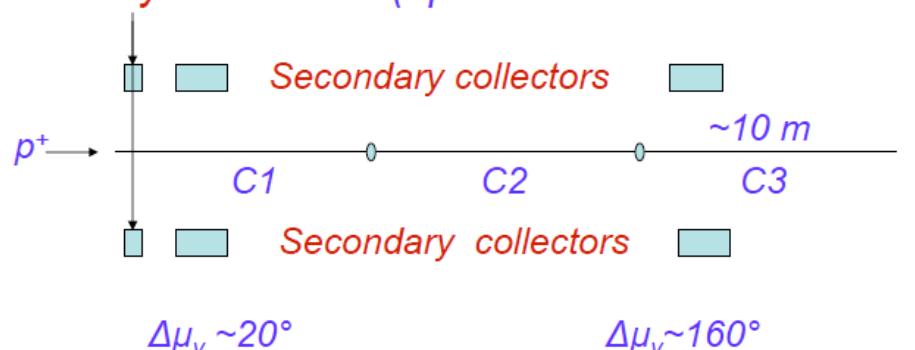

### NFFAG and IFFAG Lattice Cells

- Cells have the arrangement: O-bd-BF-BD-BF-bd-O.
- NFFAG: non-isochronous ;  $\xi_v = 0$ ,  $\xi_h = 0$ .
- IFFAG: isochronous ( $\gamma_t = \gamma$ ) ;  $\xi_v = 0$ ,  $\xi_h = +ve$ .
- NFFAGI and IFFAGI have normal & insertion cells.
- Different length straights in normal & insertion cells.
- There is closed orbit matching between single cells.

**Primary collimators (upstream end of 4.4 m straight)**

# Proton driver for ADS

## Design works

- ➊ Non-zero chromatic (linear) FFAG: A.G.Ruggiero (BNL)
- ➋ Zero chromatic (isochronous) FFAG: C.Johnstone(FNAL)
- ➌ Zero chromatic (non-linear) FFAG: Y. Mori(KURRI)
  - ➍ 1-2GeV, 10MW (single ring)

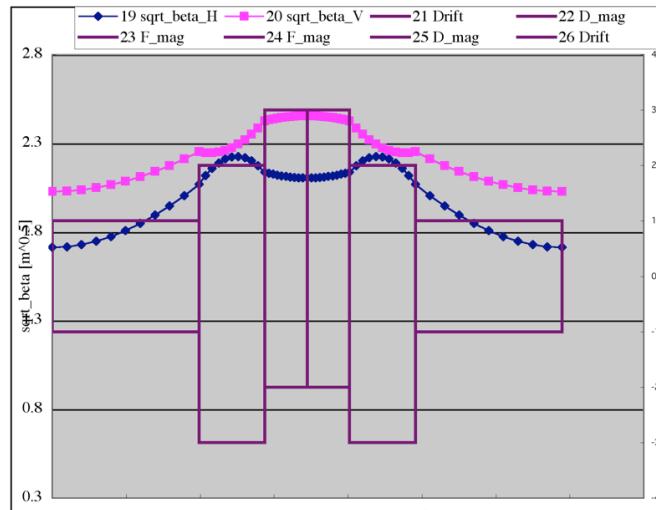

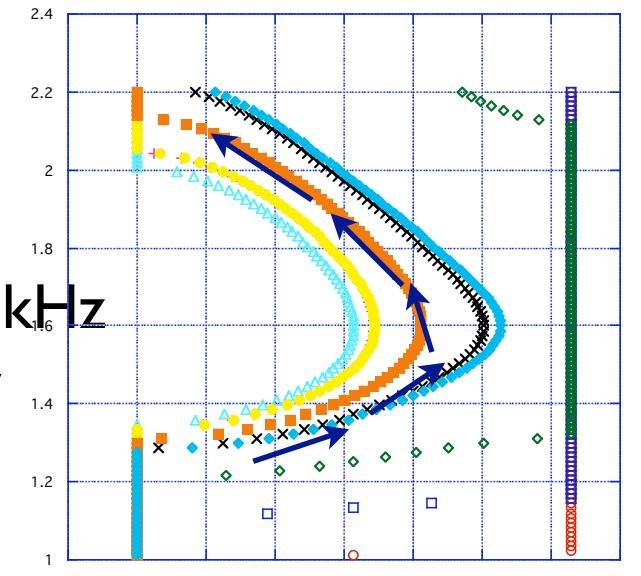

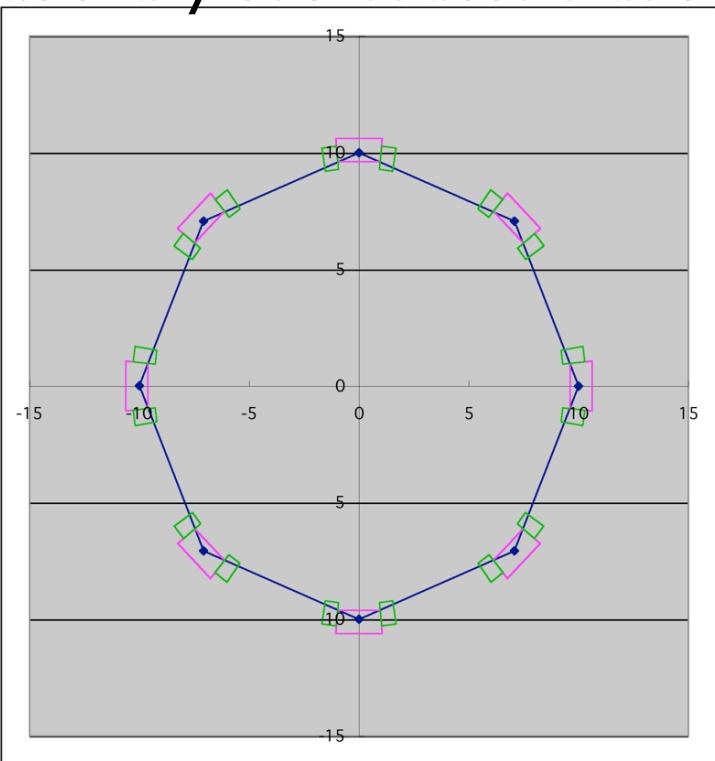

## Development for basic ADS study

- ➊ Scaling FFAGs at Kyoto University(KURRI)
- ➋ 150MeV
- ➌ Combined experiment with KUCA(sub-critical reactor)

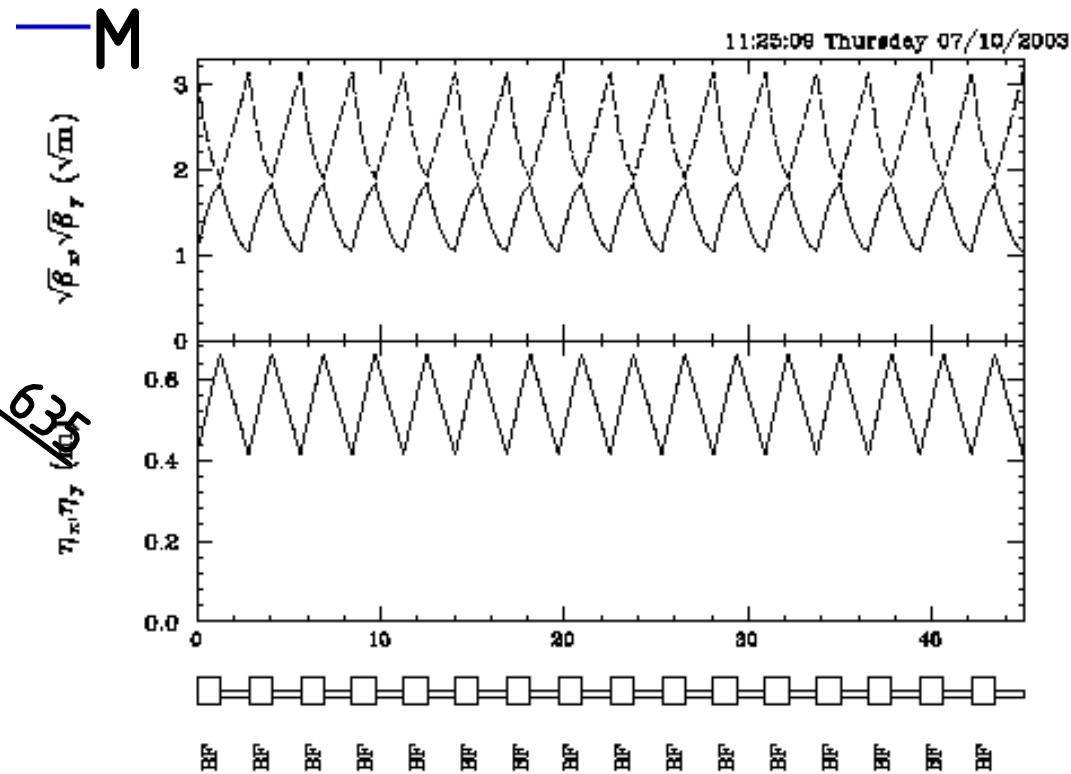

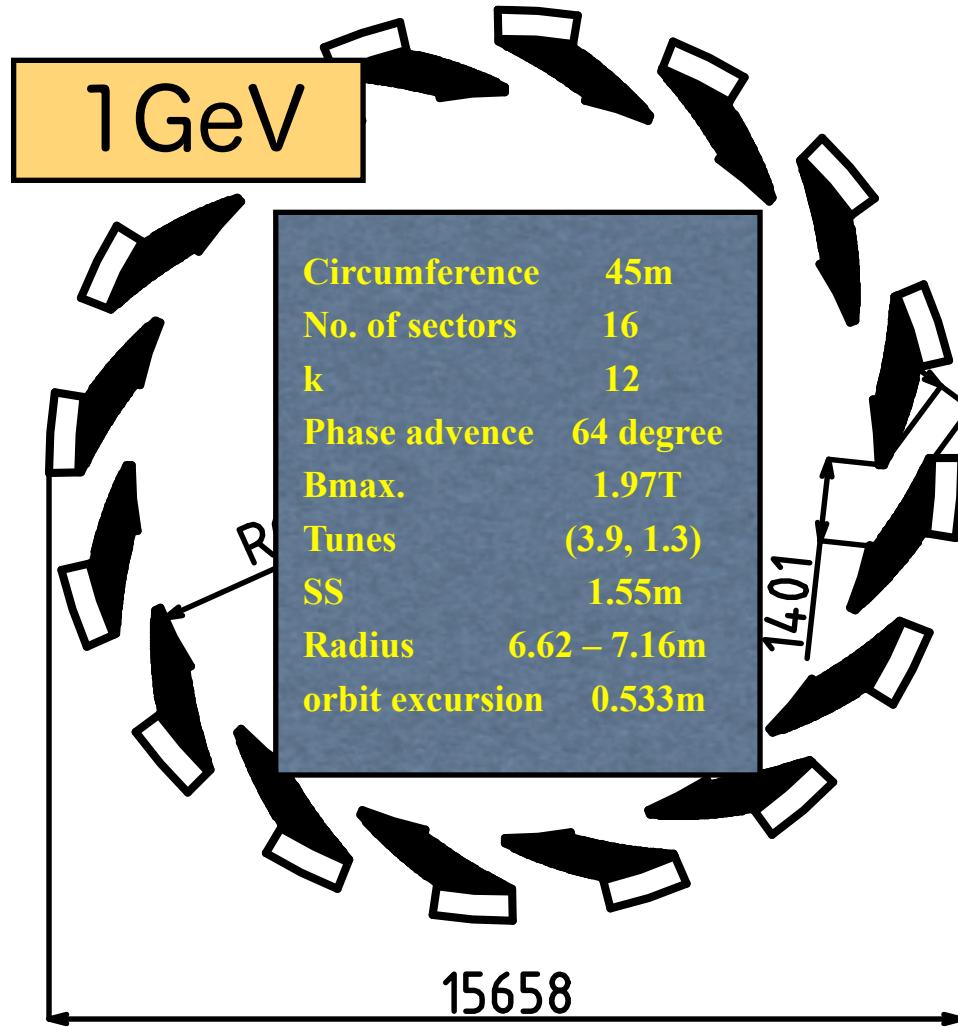

# Zero chromatic(scaling) FFAG for ADSR (I)

- Energy ~1GeV
- $k=3.7$  (FDF lattice)
- Radius: 10m
- $B \sim 3T$  : Super ferric (High temperature)
- Variable frequency acceleration:  $f=2.5\sim 5\text{MHz}$ , 1MV, 1kHz
- Stationary bucket acceleration:  $f=25\text{MHz}$ , 100MV, cw

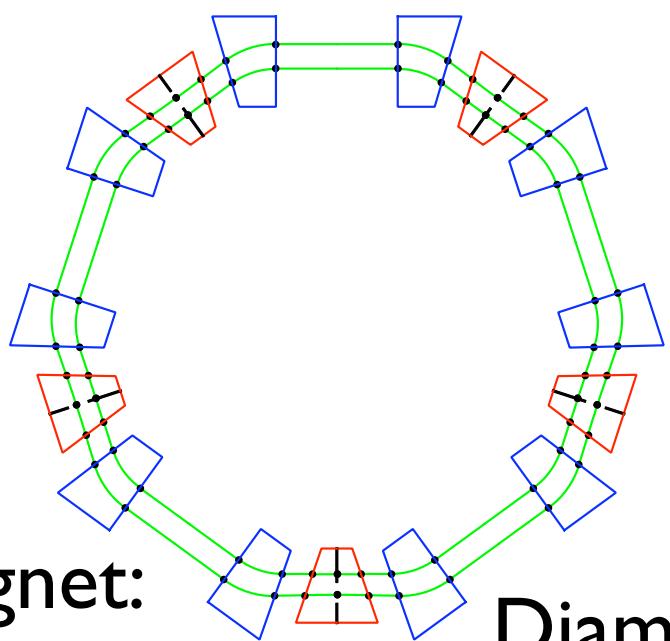

# Zero chromatic(scaling) FFAG for ADSR (2)

## Spiral lattice

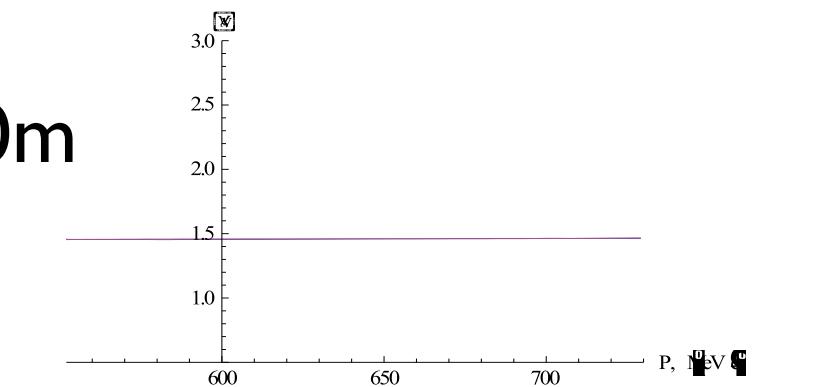

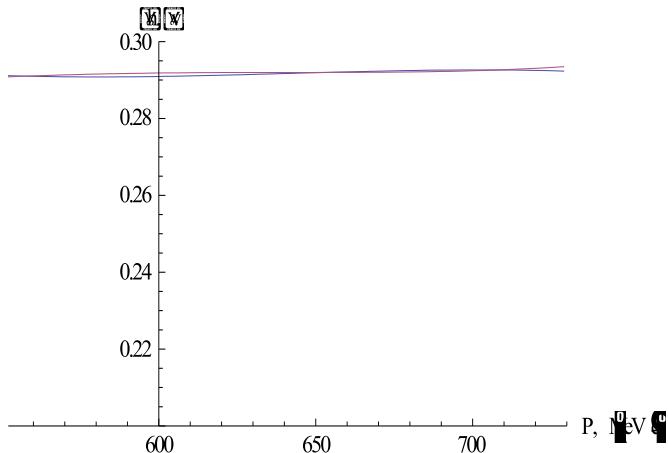

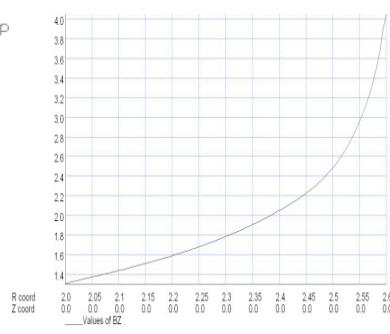

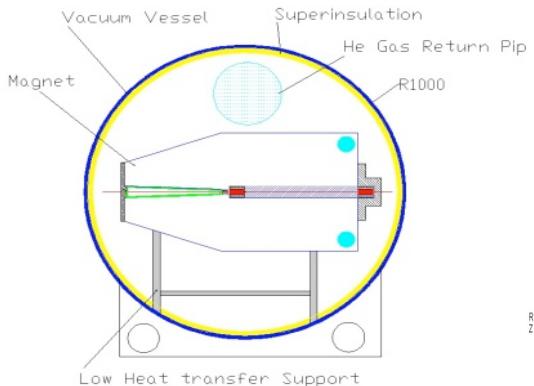

# Zero-chromatic(isochronous)FFAG for ADSR C.Johnstone(FNAL)

SC magnet:  
4T

Diameter ~10m

Tune per cell with up to duo-decapole (top)  
and ring tune (bottom)

# Summary

## Beam power efficiency

- ➊ Beam power efficiency is an issue for high intensity accelerator.

$$BPE = \frac{\text{beam power } (E \times I_{\text{beam}})}{\text{total operational power}}$$

- ➋ BPE>30% for  $P_b > 10\text{MW}$ , otherwise
  - ➌ Environment problem:CO<sub>2</sub>
  - ➌ ADSR becomes nonsense ; Creating nuclear wastes more than treating!
- ➌ Superconducting magnet
  - ➌ High temperature SC is very attractive.
